

Maritime Suite: MARlogger

Transparency, real-time calculation, flexibility

Maritime Suite:

The digital solution for the maritime industry. Digital services can be selected as needed.

On-premise solution for data acquisition and processing

MARlogger permanently stores the data on a maritime industrial PC, a proven data acquisition and processing system (DAHS)

Combination of different calculation methods

MARlogger is able to apply various methods for calculating the mass flow of emissions. The calculation is automated.

More transparency, more comparability

The integrated data export simplifies the creation of customer-specific emission diagrams - and thus offers more transparency for the ship operator at a glance.

Flexibility and remote access

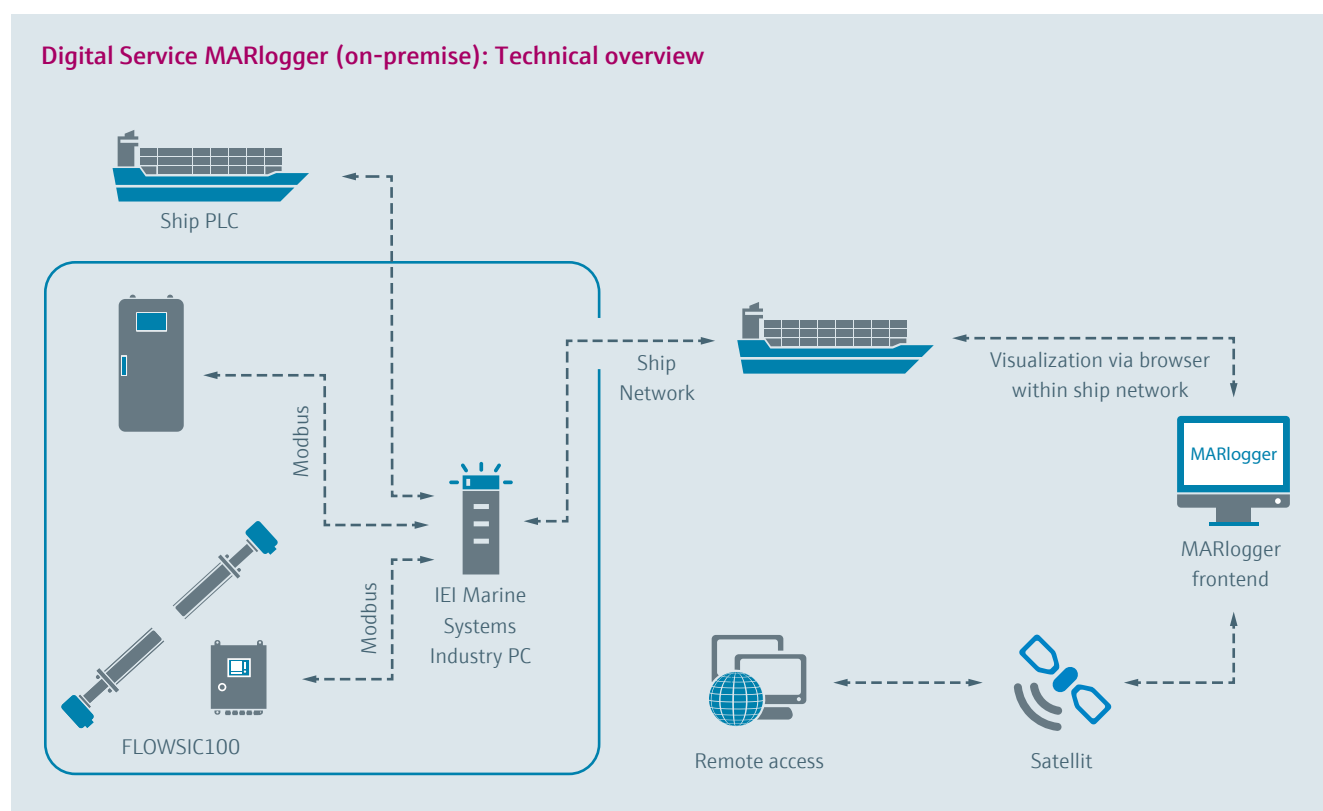

Store, evaluate and analyze data - Anytime, anywhere. The access from anywhere on board is possible via the secure web application.

Calculation and export of real-time emissions based on different calculation methods

Benefit from the experience of a leading manufacturer in maritime emission monitoring: With the Maritime Suite you gain more transparency over your fleet – tailored and in real time. MARlogger offers a complete emission transparency for vessel operators. As part of the Maritime Suite, this data acquisition and handling system calculates by

combining emission values and exhaust flow, the emission mass flow for different emitters. MARlogger uses different calculation methods. The flow value can be provided via direct flow measurement or calculation from process data according to the carbon-balance method.
