

Petrochem: CO₂ in caustic wash tower inlets

CO₂ measurement point at caustic wash tower inlet

Benefits at a glance

- Fast response to CO₂ concentration changes
- Laser-based measurement is highly selective and accurate for CO₂ in cracked gas
- Non-contact laser measurement avoids fouling and corrosion for reliable long term operation
- Low maintenance and OPEX costs – no cylinders of carrier gases or other consumables

Carbon dioxide in cracked gas

Carbon dioxide is formed during steam cracking of hydrocarbon feed stocks. CO₂ must be removed from the cracked gas because it can freeze up and damage cryogenic fractionation equipment and will poison and deactivate polymerization catalysts. Inside a caustic wash tower, cracked gas is contacted with a countercurrent stream of aqueous sodium hydroxide (NaOH) which reacts with CO₂ forming sodium carbonate (Na₂CO₃) and sodium bicarbonate (NaHCO₃) which are absorbed in the liquid phase. Fresh NaOH solution must be added to maintain efficiency of the CO₂ scavenging reaction within the caustic wash tower.

Carbon dioxide measurement

All cracked gas passes through the caustic wash tower, so maintaining the scavenging efficiency of NaOH for CO₂ and H₂S directly affects plant operation. Monitoring the CO₂ concentration in cracked gas entering a caustic wash tower provides information needed to control NaOH concentration and compensate for changes in CO₂ loading and NaOH depletion.

Endress+Hauser's solution

Tunable diode laser absorption spectroscopy (TDLAS) is a SpectraSensors technology that has proven highly effective in this critical measurement. TDLAS analyzers have an exceptionally fast response to changes in CO₂ concentration, an important performance characteristic for monitoring and controlling CO₂ removal in caustic wash tower units. Laser and detector components are isolated and protected from process gas and contaminants avoiding fouling and corrosion and ensuring stable long-term operation.

Application data

Target component (Analyte)	Carbon dioxide in caustic wash tower inlets
Typical measurement range	0-500 ppmv*
Typical repeatability	±2% of full scale
Measurement response time	1 to ~60 seconds*
Principle of measurement	Non-differential tunable diode laser absorption spectroscopy (TDLAS)
Validation	Certified blend of CO ₂ in nitrogen balance

*Application specific; consult factory.

Typical background stream composition

Component	Unit	Typical concentration	Min for application	Max for application
Carbon dioxide (CO ₂)	ppmv	200	10	500
Hydrogen sulfide (H ₂ S)	ppmv	500	0	1000
Hydrogen (H ₂)	mol%	25	15	30
Methane (CH ₄)	mol%	20	10	30
Ethane (C ₂ H ₆)	mol%	15	10	30
Ethylene (C ₂ H ₄)	mol%	25	20	40
Acetylene (C ₂ H ₂)	mol%	0.3	0	0.5
Propylene (C ₃ H ₆)	mol%	7.5	0	15
Propane (C ₃ H ₈)	mol%	7.5	0	15
Methyl acetylene propyne (C ₃ H ₄)	mol%	0.03	0	0.1
Propadiene (C ₃ H ₄)	mol%	0.02	0	0.1
Carbon monoxide (CO)	mol%	0.05	0	0.1
Butanes	mol%	0.05	0	0.1
Butenes	mol%	0.3	0	0.5
1,3-Butadiene	mol%	0.5	0	1
C ₅ +	mol%	0.1	0	0.5
Total	mol%	100		

The background stream composition must be specified for proper calibration and measurement performance. Specify the normal composition, along with the minimum and maximum expected values for each component, especially CO₂, the measured component. Other stream compositions may be allowable with approval from Endress+Hauser.
