SNG: CO_2 absorber outlet

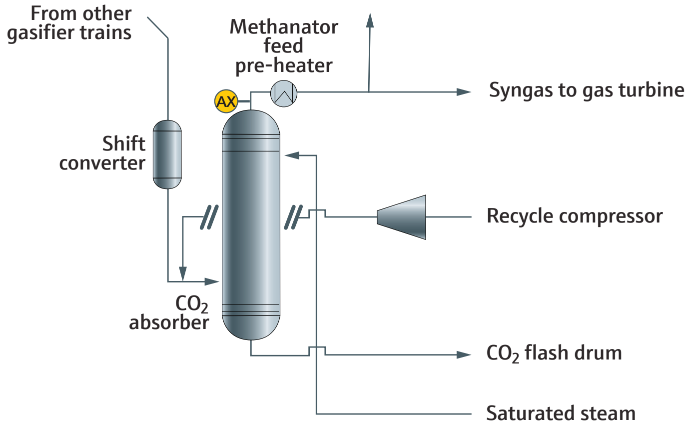

Figure 1: Typical CO_2 absorber outlet measurement point*

Benefits at a glance

- Unique spectroscopic capability to measure all syngas components, including H_2 and N_2
- Pipe-centric sampling and measurement at the sample tap
- Sample can often be returned to process, avoiding disposal to flare header
- Complete syngas speciation
- No valves, columns, or carrier gas
- No interference from moisture vapor in the raw syngas sample when the sample is kept above its dewpoint

In an IGCC plant utilizing carbon capture and storage (CCS), the first stage of upgrading the syngas effluent from the shift converter is the removal of CO_2 that was produced in the water-shift reaction. CO_2 removal is typically done by solvent-based amine treatment absorbers and regenerators or strippers. This pre-combustion carbon removal is an efficient way to reduce CO_2 emissions from the plant. The captured CO_2 can be transported off-site for enhanced oil recovery (EOR), or it can be sequestered for long term storage in depleted underground gas fields or injected into the sea floor. Other options include using captured CO_2 as a feedstock for the synthesis of other useful chemicals, such as urea and methanol.[1]

Measurement of syngas in the CO_2 absorber outlet

The Raman Rxn5 analyzer is a unique integrated sampling and measurement solution for the CO_2 absorber outlet stream. A typical Raman spectrum and composition for this stream is shown in Figure 2. Note the simplicity and complete speciation of individual spectral peaks in the Raman spectrum. Any residual moisture still present in the stream after the absorber dryer is not visible in the frequency range of the spectrum. Hence, it cannot interfere with the analysis and a dry basis result is provided. No other spectroscopic technique is capable of measuring the H_2 and N_2 diatomics in this stream. In addition, the measurement is based on a normalized analysis, which makes it very robust against pressure and temperature changes as well as any slow fouling that may occur.

Reliability issues with traditional methods for CO_2 absorber outlet analysis

In general, the CO_2 absorber outlet stream composition is measured with process gas chromatography (GC) or mass spectrometry (MS). Both technologies require transporting and conditioning the sample at both the sample tap and at the sample conditioning panel close to the analyzer. Protecting the GC or MS analyzers from even small amounts of liquid carryover after the absorber dryer becomes the main sampling system challenge as this event can damage columns in a GC or damage the ionization chamber in a MS. The Rxn-30 probe cannot be damaged by liquid carryover or fouling and cleaning is simple and straightforward.

Solution: Raman Rxn5 analyzer with CO_2 absorber outlet method

In the case of relatively clean and dry streams like a natural gas feed, the Raman Rxn5 analyzer with an Rxn-30 probe allows for a wide range of sample pressure (70-800 psia typical) and sample temperature (-40 to 150°C). The Rxn-30 probe can be easily integrated into sample conditioning systems to measure process streams at higher temperatures and pressures. The ability to measure at higher pressures often allows the sample to be returned to the process at a lower pressure sampling point - flaring of the returned sample is avoided. Sampling lag time is essentially zero, as no sample transport is required, increasing the speed of analysis.

The Raman Rxn5 analyzer for the CO_2 absorber outlet contains the following per measurement point:

- Dedicated laser module
- Rxn-30 fiber optic probe
- Industrial hybrid electro-optical cable (up to 150 m long, customized to your plant requirements)
- Combined pressure and temperature sensor with cable (up to 150 m long, customized to your plant requirements)
- Dedicated CO_2 absorber outlet method

Typical process conditions	P (barg)	T (°C)
At sample tap	41	42
At Rxn-30 probe	41	45

Typical stream composition

Component	Range (Mol%)	Normal (Mol%)	Precision (Mol%) k=2	Cal gas (Mol%)	Precision (Mol%) k=2
Hydrogen	40-95	72.8	0.03	64	0.03
Nitrogen	0-35	0.6	0.01	16	0.02
Carbon monoxide	0-35	23.2	0.02	7	0.01
Carbon dioxide	0-30	0.5	0.01	10	0.02
Methane	0-35	2.9	0.01	3	0.01
Argon	0-2	0.7	N/M	0	N/M
