Clamp-on meter with Heartbeat Technology and web server for the water and wastewater industry

**Application**
- The measuring principle is non-invasive and independent of pressure, density and conductivity
- Bidirectional measurement for water and wastewater as well as process water and hydropower plants

**Device properties**
- Mounting without process interruption
- Wide nominal diameter range: DN 15 to 4000 (½ to 160")
- Medium temperature up to +130 °C (+266 °F)
- Transmitter housing made of durable polycarbonate or aluminium
- Remote version for wall mounting
- Integrated data logger: measured values monitoring

**Your benefits**
- Short inlet run thanks to FlowDC
- Low capital investment – cost-effectiveness increases with pipe diameter (up to DN 4000/160")
- Long-term stable signal – maintenance-free permanent mounting from outside with coupling pads
- Reliable measurement on various pipe materials – sensor for GRP and plastic pipes available
- Safe operation – no need to open the device due to display with touch control, background lighting
- Full remote access – web server
- Integrated diagnostics, verification and monitoring – Heartbeat Technology

### Function and system design

**Measuring principle**

The measuring system uses a measurement method based on the transit time difference. In this measurement method, acoustic signals (ultrasonic) are transmitted between two sensors. Signal transmission is bidirectional, i.e. the sensor operates as both a sound transmitter and a sound receiver.

As the speed of propagation of the sound waves is slower against the flow direction than in the flow direction, this results in a transit time difference. This transit time difference is directly proportional to the flow velocity.

The measuring system calculates the volume flow of the medium from the measured transit time difference and the pipe cross-sectional area. The sound velocity of the medium is simultaneously measured along with the transit time difference. With this additional measured variable, it is possible to differentiate between different media or monitor the medium quality.
Measuring system

The measuring system consists of a transmitter and one or two sensor sets. The transmitter and sensor sets are mounted in physically separate locations. They are interconnected by sensor cables.

The measuring system uses a measurement method based on the transit time difference. Here, the sensors work as sound generators and sound receivers. Depending on the application and version, the sensors can be arranged for a measurement via 1, 2, 3 or 4 traverses → 6.

The transmitter serves to control the sensor sets, to prepare, process and evaluate the measuring signals, and to convert the signals to the desired output variable.

Sensor cables

Sensor cables can be ordered in different lengths → 56

- Length: max. 30 m (90 ft)
- Cable with a common shield and individual shielded cores
Sensor

**Prosonic Flow W**

*DN 15 to 65 (½ to 2¼")*

*DN 50 to 4000 (2 to 160")*

- Measurement of:
  - Pure liquids or slightly contaminated liquids
  - Water, e.g. drinking water, industrial water, saltwater, de-ionized water and cooling and heating water
  - Nominal diameter range: DN 15 to 4000 (½ to 160")
- Materials:
  - Sensor holder: Stainless steel 1.4404 (316L)
  - Sensor housing: Stainless steel 1.4404 (316L)
  - Strapping band/bracket: Stainless steel 1.4404 (316L)
- Sensor contact surface: Chemically stable plastic

Example: 1 sensor set with 2 traverses

**Accessories for mounting**

The necessary distances must be determined for the sensors. Information about the medium, the pipe material used and the exact pipe dimensions is required to determine these values. The values for the sound velocity of the following media, pipe materials and liner materials are saved in the transmitter:

<table>

**Sensor set selection and arrangement**

If mounting horizontally, always mount the sensor set so that it is offset at an angle of at least ±30° to the top of the measuring pipe to avoid incorrect measurements caused by empty space at the top of the pipe.
The sensors can be arranged in different ways:

- Mounting arrangement for measurement with 1 sensor set (1 measuring path):
  - The sensors are located on opposite sides of the pipe (offset by 180°): measurement with 1 or 3 traverses
  - The sensors are located on the same side of the pipe: measurement with 2 or 4 traverses
- Mounting arrangement for measurement with 2 sensor sets (2 measuring paths):
  - 1 sensor of each sensor set is located on the opposite side of the pipe (offset by 180°): measurement with 1 or 3 traverses
  - The sensors are located on the same side of the pipe: measurement with 2 or 4 traverses

The sensor sets are arranged on the pipe, offset by 90°.

**Using 5 MHz sensors**

Here, the rails of the two sensor sets are always arranged at an angle of 180° to one another and connected by cables for all measurements with 1, 2, 3 or 4 traverses. The sensor functions are assigned in the two rails via the transmitter electronics unit depending on the selected number of traverses. It is not necessary to swap the cables in the transmitter between the channels.
Operating frequency selection
The sensors of the measuring device are available with adapted operating frequencies. These frequencies are optimized for different properties of measuring pipes (material, pipe wall thickness) and media (kinematic viscosity) for the resonance behavior of the measuring pipes. If these properties are known, an optimum selection can be made according to the following tables. If these properties are not (completely) known, the sensors can be assigned as follows:
- 5 MHz for DN 15 to 65 (½ to 2½")
- 2 MHz for DN 50 to 300 (2 to 12")
- 1 MHz for DN 100 to 4000 (4 to 160")
- 0.5 MHz for DN 150 to 4000 (6 to 160")
- 0.3 MHz for DN 1000 to 4000 (40 to 160")

<td>–</td>
</tr>
</tbody>
</table>

1) The table shows a typical selection. In critical situations, the optimum sensor type may differ from these recommendations.

- If clamp-on sensors are used, a 2 traverse-type installation is recommended. This is the easiest and most convenient type of installation, particularly for measuring devices whose pipe can only be accessed with difficulty from one side.
- A 1 traverse installation is recommended for the following installation conditions:
  - Certain plastic pipes with a wall thickness >4 mm (0.16 in)
  - Pipes made of composite materials (e.g. glass-fiber reinforced plastic)
  - Lined pipes
  - Applications with media with high acoustic damping
Operation

Single-path measurement

In the case of single-path measurement, the flow is measured at the measuring point without the option of compensation.

For this it is necessary to adhere strictly to the specified inlet and outlet runs after disturbances in the measuring pipe (e.g. elbows, extensions, reductions).

To ensure the best possible measurement performance and measuring accuracy, the configuration with two sensor sets with FlowDC is recommended.

Two-path measurement

In the case of two-path measurement, the flow is measured by two measurements at the measuring point.

The two sensor sets are mounted at one measuring point with one or two traverses for this purpose. It is generally possible to arrange the sensors on one or two different measurement planes. If the sensors are installed with two measurement planes, a minimum sensor plane rotation of 30° in relation to the pipe axis must be observed.

The average of the measured values of both sensor sets is calculated. The configuration of the measurement is only performed once and is adopted for both measuring paths.

When extending the measuring point from single-path measurement to two-path measurement, an identical sensor must be selected.

Two-path measurement with FlowDC

In the case of two-path measurement with FlowDC, the flow is measured by two measurements at the measuring point.

For this, the two sensor sets are installed on the measuring pipe, offset at a specific angle to one another (180° for 1 traverse, 90° for 2 traverses). This is independent of the rotation position of the two sensor sets on the measuring pipe.

The measured values of both sensor sets are averaged. Based on this average measurement value, the measured value is compensated depending on the type of disturbance and the distance from the measuring point to the disturbance point. This makes it possible to maintain the specified accuracy and repeatability for measurements in non-ideal conditions (e.g. short inlet runs), with inlet runs up to only 2x DN before and after the measuring point.

The configuration of the two measuring paths is only performed once and is adopted for both measuring paths.

---

2) Order code for "Mounting type", option A2 "Clamp-on, 2-channel, 2-sensor sets"
3) Order code for "Application package", option EN "FlowDC"
4) Flow disturbance compensation
Two-path measurement: examples for the horizontal arrangement of the sensor sets at a measuring point

A → Installation of the sensor sets for measurement via 1 traverse
B → Installation of the sensor sets for measurement via 2 traverses
C → Non-recommended installation range with horizontal orientation (60°)
D → Recommended installation range max. 120°

If FlowDC is not used, it is necessary to adhere strictly to the specified inlet and outlet runs after disturbances in the measuring pipe (e.g. elbows, extensions, reductions) to obtain correct flow measured values.

Equipment architecture

Possibilities for integrating measuring devices into a system

1 → Control system (e.g. PLC)
2 → 4 to 20 mA HART, pulse/frequency/switch output
3 → Non-hazardous area
4 → Non-hazardous area and Zone 2/Div. 2

Security

IT security

Our warranty is valid only if the device is installed and used as described in the Operating Instructions. The device is equipped with security mechanisms to protect it against any inadvertent changes to the settings.

IT security measures, which provide additional protection for the device and associated data transfer, must be implemented by the operators themselves in line with their security standards.
Device-specific IT security

The device offers a range of specific functions to support protective measures on the operator's side. These functions can be configured by the user and guarantee greater in-operation safety if used correctly. An overview of the most important functions is provided in the following section:

<table>
<thead>
<tr>
<th>Function/interface</th>

Protecting access via a password

Different passwords are available to protect write access to the device parameters or access to the device via the WLAN interface.

- **User-specific access code**
  Protect write access to the device parameters via the local display, Web browser or operating tool (e.g. FieldCare, DeviceCare). Access authorization is clearly regulated through the use of a user-specific access code.

- **WLAN passphrase**
  The network key protects a connection between an operating unit (e.g. notebook or tablet) and the device via the WLAN interface which can be ordered as an option.

**User-specific access code**

Write access to the device parameters via the local display or operating tool (e.g. FieldCare, DeviceCare) can be protected by the modifiable, user-specific access code.

**WLAN passphrase: Operation as WLAN access point**

A connection between an operating unit (e.g. notebook or tablet) and the device via the WLAN interface, which can be ordered as an optional extra, is protected by the network key. The WLAN authentication of the network key complies with the IEEE 802.11 standard.

When the device is delivered, the network key is pre-defined depending on the device. It can be changed via the **WLAN settings** submenu in the **WLAN passphrase** parameter.

**General notes on the use of passwords**

- The access code and network key supplied with the device should be changed during commissioning.
- Follow the general rules for generating a secure password when defining and managing the access code or network key.
- The user is responsible for the management and careful handling of the access code and network key.

**Access via Web server**

The device can be operated and configured via a Web browser with the integrated Web server. The connection is via the service interface (CDI-RJ45) or the WLAN interface.

The Web server is enabled when the device is delivered. The Web server can be disabled if necessary (e.g. after commissioning) via the **Web server functionality** parameter.
The device and status information can be hidden on the login page. This prevents unauthorized access to the information.

For detailed information on device parameters, see:
The 'Description of Device Parameters' document

## Input

### Measured variable

**Direct measured variables**
- Volume flow
- Flow velocity
- Sound velocity

**Calculated measured variables**
Mass flow

### Measuring range

$v = 0 \text{ to } 15 \text{ m/s (0 to 50 ft/s)}$

- Measuring range depending on the sensor version.
- To calculate the measuring range, use the Applicator sizing tool → 58

### Operable flow range
Over 150 : 1

### Input signal

**External measured values**

Interfaces that allow externally measured variables (temperature, density) to be transmitted to the measuring device are optionally available for the device.

**HART protocol**
The measured values are written from the automation system to the measuring device via the HART protocol. The temperature and density measuring device must support the following protocol-specific functions:
- HART protocol
- Burst mode

### Status input

| Maximum input values               | DC 30 V  
|------------------------------------|-----------
|                                    | 6 mA      |

| Response time                      | Configurable: 5 to 200 ms |

| Input signal level                  | Low signal (low): DC –3 to +5 V  
|------------------------------------|-------------------------------
|                                    | High signal (high): DC 12 to 30 V |

|Assignable functions               | Off  
|-----------------------------------|-----------------------------------
|                                   | Reset totalizers 1-3 separately  
|                                   | Reset all totalizers  
|                                   | Flow override                    |

Status input

16  Connection example for status input
1  Automation system with status output (e.g. PLC)
2  Power supply
3  Transmitter
**Potential equalization**

**Requirements**

For potential equalization:
- Pay attention to in-house grounding concepts
- Take account of operating conditions like the pipe material and grounding
- Connect the sensor and transmitter to the same electrical potential
- Use a ground cable with a minimum cross-section of 6 mm² (0.0093 in²) for the potential equalization connections

**Terminals**

Transmitter

Supply voltage cable: plug-in spring terminals for wire cross-sections 0.5 to 2.5 mm² (20 to 14 AWG)

**Cable entries**

Cable entry thread

- M20 x 1.5
- Via adapter:
  - NPT ½"
  - G ½"

Cable gland

M20 × 1.5 with cable Ø 6 to 12 mm (0.24 to 0.47 in)

If metal cable entries are used, use a grounding plate.

**Cable specification**

Permitted temperature range

- The installation guidelines that apply in the country of installation must be observed.
- The cables must be suitable for the minimum and maximum temperatures to be expected.

**Power supply cable (incl. conductor for the inner ground terminal)**

Standard installation cable is sufficient.

**Signal cable**

*Current output 0/4 to 20 mA*

Standard installation cable is sufficient.

*Current output 4 to 20 mA HART*

A shielded cable is recommended. Observe grounding concept of the plant.

*Pulse/frequency/switch output*

Standard installation cable is sufficient.

*Status input*

Standard installation cable is sufficient.

**Connecting cable between the transmitter and sensor**

1. Non-hazardous area
2. Hazardous area: Zone 2; Class I, Division 2
3. Proline 400 transmitter
4. Sensor set with sensor cable to transmitter 400 →  21

*Transmitter and sensor installed in the hazardous area: Zone 2; Class I, Division 2*
Sensor cable for sensor - transmitter

| Standard cable | • TPE: -40 to +80 °C (-40 to +176 °F)  
• TPE halogen-free: -40 to +80 °C (-40 to +176 °F)  
• PTFE: -40 to +130 °C (-40 to +266 °F) |
<table>

<td>Cable lengths (available for order)</td>
<td>5 m (15 ft), 10 m (30 ft), 15 m (45 ft), 30 m (90 ft)</td>
</tr>
</tbody>
</table>
| Operating temperature | Depends on the device version and how the cable is installed:  
Standard version:  
• Cable, fixed installation \(^1\): minimum -40 °C (~-40 °F)  
• Cable, movable: minimum -25 °C (~-13 °F)  

1) Compare details under the 'Standard cable' row

Performance characteristics

Reference operating conditions

- Error limits following ISO/DIS 11631
- Specifications as per measurement report
- Accuracy information is based on accredited calibration rigs that are traced to ISO 17025.

To obtain measured errors, use the Applicator sizing tool → \( \text{58} \)

Maximum measured error

o.r. = of reading

The measured error depends on a number of factors. A distinction is made between the measured error of the device (0.5% o.r.) and an additional installation-specific measured error (typically 1.5% o.r.) that is independent of the device.

The installation-specific measured error depends on the installation conditions on site, such as the nominal diameter, wall thickness, real pipe geometry or medium. The sum of the two measured errors is the measured error at the measuring point.

![Graph](image)

17 Example of the measured error in a pipe with a nominal diameter DN > 200 (8”)

1. Measured error of measuring device: 0.5% o.r. ± 3 mm/s (0.12 in/s)
2. Measured error due to installation conditions: typically 1.5% o.r.
3. Measured error at the measuring point: 0.5% o.r. ± 3 mm/s (0.12 in/s) + 1.5% o.r. = 2% o.r. ± 3 mm/s (0.12 in/s)

Measured error at the measuring point
The measured error at the measuring point is made up of the measured error of the device (0.5% o.r.) and the measured error resulting from the installation conditions on site. With a flow velocity > 0.3 m/s (1 ft/s) and a Reynolds number > 10,000, the following are typical error limits:

<table>
<thead>
<tr>
<th>Nominal diameter</th>
<th>Device error limits</th>
<th>Installation-specific error limits (typical)</th>
<th>Error limits at the measuring point (typical)</th>
<th>Field calibration</th>
</tr>
</thead>
<tbody>
<tr>
<td>DN 15 (½&quot;)</td>
<td>±0.5% o.r. ± 5 mm/s (0.20 in/s)</td>
<td>+ ±2.5% o.r.</td>
<td>→ ±3% o.r. ± 5 mm/s (0.20 in/s)</td>
<td>±0.5% o.r. ± 5 mm/s (0.20 in/s)</td>
</tr>
<tr>
<td>DN 25 to 200 (1 to 8&quot;)</td>
<td>±0.5% o.r. ± 7.5 mm/s (0.30 in/s)</td>
<td>+ ±1.5% o.r.</td>
<td>→ ±2% o.r. ± 7.5 mm/s (0.30 in/s)</td>
<td>±0.5% o.r. ± 7.5 mm/s (0.30 in/s)</td>
</tr>
<tr>
<td>&gt; DN 200 (8&quot;)</td>
<td>±0.5% o.r. ± 3 mm/s (0.12 in/s)</td>
<td>+ ±1.5% o.r.</td>
<td>→ ±2% o.r. ± 3 mm/s (0.12 in/s)</td>
<td>±0.5% o.r. ± 3 mm/s (0.12 in/s)</td>
</tr>
</tbody>
</table>

1) Adjustment in relation to a reference with correction values written back to the transmitter

**Measurement report**

If required, the device can be supplied with a factory measurement report. A measurement is performed under reference conditions to verify the performance of the device. Here, the sensors are mounted on a pipe with a nominal diameter of DN 50 (2") or DN 100 (4").

With a flow velocity of > 0.3 m/s (1 ft/s) and a Reynolds number > 10,000, the following error limits are guaranteed with the measurement report:

<table>
<thead>
<tr>
<th>Nominal diameter</th>
<th>Device error limits</th>
</tr>
</thead>
<tbody>
<tr>
<td>50 (2&quot;)</td>
<td>±0.5% o.r. ± 5 mm/s (0.20 in/s)</td>
</tr>
<tr>
<td>100 (4&quot;)</td>
<td>±0.5% o.r. ± 7.5 mm/s (0.30 in/s)</td>
</tr>
</tbody>
</table>

The specification applies for Reynolds numbers Re ≥ 10,000. Larger measured errors can occur for Reynolds numbers Re < 10,000.
Example for max. measured error (volume flow)

![Graph showing measured error in volume flow as a percentage of reading vs. flow velocity in meters per second and feet per second.]

18 Example for max. measured error (volume flow) in % o.r.

1 Pipe diameter < DN 100 (4"

2 Pipe diameter ≥ DN 100 (4"

Repeatability

</tr>
</tbody>
</table>

Mounting

<table>
<thead>
<tr>
<th>Mounting location</th>
</tr>
</thead>
</table>

Endress+Hauser 23
To prevent measuring errors arising from accumulation of gas bubbles in the measuring pipe, avoid the following mounting locations in the piping:
- Highest point of a pipeline.
- Directly upstream of a free pipe outlet in a down pipe.

### Orientation

<table>
<thead>
<tr>
<th>Orientation views</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
</tr>
<tr>
<td>2</td>
</tr>
<tr>
<td>3</td>
</tr>
<tr>
<td>4</td>
</tr>
<tr>
<td>A</td>
</tr>
<tr>
<td>B</td>
</tr>
<tr>
<td>C</td>
</tr>
</tbody>
</table>

**Vertical**

Recommended orientation with upward direction of flow (View A). With this orientation, entrained solids will sink and gases will rise away from the sensor area when the medium is not flowing. Furthermore, the pipe can be completely drained and protected against the buildup of deposits.

**Horizontal**

In the recommended installation range with a horizontal orientation (View B), gas and air accumulations at the top of the pipe and interference from deposit buildup at the bottom of the pipe can influence the measurement to a lesser degree.

### Inlet and outlet runs

If possible, the sensor should be installed upstream from valves, T-sections, pumps etc. If this is not possible, the inlet and outlet runs indicated below must be maintained at the very minimum in order to attain the specified level of accuracy of the measuring device. If there are several flow disturbances present, the longest specified inlet run must be maintained.

- Shorter inlet and outlet runs are possible with the following device versions:
  - Two-path measurement with 2 sensor sets and order code for "Application package", option EN "FlowDC" (for item numbers 1 to 4b):
    - Up to minimum 2 × DN for inlet run, 2 × DN for outlet run

---

6) Order code for "Mounting type", option A2 'Clamp-on, 2-channel, 2-sensor sets'
20 Minimum inlet and outlet runs with FlowDC with various flow obstructions

1  Pipe bend
2  Two pipe bends (on one plane)
3  Two pipe bends (on two planes)
4a Reduction
4b Extension

21 Minimum inlet and outlet runs without FlowDC with 1 or 2 sensor sets with various flow obstructions

1  Pipe bend
2  Two pipe bends (on one plane)
3  Two pipe bends (on two planes)
4a Reduction
4b Extension
5  Control valve (2/3 open)
6  Pump

Mounting the sensor

⚠️ WARNING

Risk of injury when mounting the sensors and strapping bands!
- Due to the increased risk of cuts, wear suitable gloves and protective goggles.
Sensor configuration and settings

<table>
<thead>
<tr>
<th>DN 15 to 65 (½ to 2½&quot;)</th>
<th>Strapping band</th>
<th>Strapping band</th>
<th>Welded bolt</th>
</tr>
</thead>
<tbody>
<tr>

<td>Measuring rail 1)(2)</td>
<td>Wire length</td>
</tr>
</tbody>
</table>

1) Depends on the conditions at the measuring point (measuring pipe, medium etc.). The dimension can be determined via FieldCare or Applicator. See also the Result sensor distance / measuring aid parameter in the Measuring point submenu.

2) Only up to DN 600 (24")

Determining the sensor mounting positions

Sensor holder with U-shaped screws

Can be used for
- Measuring devices with measuring range DN 15 to 65 (½ to 2½")
- Mounting on pipes DN 15 to 32 (½ to 1¼")

Procedure:
1. Disconnect the sensor from the sensor holder.
2. Position the sensor holder on the measuring pipe.
3. Fit the U-shaped screws through the sensor holder and lightly grease the thread.
4. Screw the nuts onto the U-shaped screws.
5. Position the sensor holder correctly and tighten the nuts uniformly.

CAUTION
Risk of damaging plastic or glass pipes if the nuts on the U-shaped screws are tightened too much!
- The use of a metal half-shell (on the opposite side of the sensor) is recommended for plastic or glass pipes.

The visible measuring pipe surface must be clean (free from flaking paint and/or rust) to ensure good acoustic contact.
Sensor holder with strapping bands (small nominal diameters)

Can be used for
- Measuring devices with measuring range DN 15 to 65 (½ to 2½"
- Mounting on pipes DN > 32 (1¼")

Procedure:
1. Disconnect the sensor from the sensor holder.
2. Position the sensor holder on the measuring pipe.
3. Wrap the strapping bands around the sensor holder and measuring pipe without twisting them.
4. Guide the strapping bands through the strapping band locks.
5. Tighten the strapping bands as tightly as possible by hand.
6. Set the sensor holder to the desired position.
7. Push down the tensioning screw and tighten the strapping bands so they cannot slip.
8. If necessary, shorten the strapping bands and trim the cut edges.
WARNING
Risk of injury!
- To avoid sharp edges, trim the cut edges after shortening the strapping bands. Wear suitable gloves and protective goggles.

The visible measuring pipe surface must be clean (free from flaking paint and/or rust) to ensure good acoustic contact.

Sensor holder with strapping bands (medium nominal diameters)
Can be used for
- Measuring devices with measuring range DN 50 to 4000 (2 to 160”)
- Mounting on pipes DN ≤ 600 (24”)

Procedure:
1. Fit the mounting bolt over strapping band 1.
2. Position strapping band 1 as perpendicular as possible to the measuring pipe axis without twisting it.
3. Guide the end of strapping band 1 through the strapping band lock.
4. Tighten strapping band 1 as tightly as possible by hand.
5. Set strapping band 1 to the desired position.
6. Push down the tensioning screw and tighten strapping band 1 so it cannot slip.
7. Strapping band 2: proceed as for strapping band 1 (steps 1 to 6).
8. Only slightly tighten strapping band 2 for final mounting. It must be possible to move strapping band 2 for final alignment.
9. If necessary, shorten both strapping bands and trim the cut edges.

WARNING
Risk of injury!
- To avoid sharp edges, trim the cut edges after shortening the strapping bands. Wear suitable gloves and protective goggles.

![Diagram of sensor holder with strapping bands](image-url)

25  Holder with strapping bands (medium nominal diameters), with hinged screw
1  Mounting bolts
2  Strapping band
3  Tensioning screw
Holder with strapping bands (medium nominal diameters), without hinged screw

Sensor holder with strapping bands (large nominal diameters)

Can be used for
- Measuring devices with measuring range DN 50 to 4000 (2 to 160")
- Mounting on pipes DN > 600 (24")
- 1-traverse mounting or 2-traverse mounting with 180° arrangement
- 2-traverse mounting with two-path measurement and 90° arrangement (instead of 180°)

Procedure:
1. Measure the pipe circumference. Note down the full/half or quarter circumference.
2. Cut the strapping bands to length (= pipe circumference + 30 mm (1.18 in)) and trim the cut edges.
3. Select the mounting location of the sensors with the given sensor distance and optimum inlet run conditions, while ensuring there is nothing impeding sensor mounting over the entire circumference of the measuring pipe.
4. Fit two strap bolts over strapping band 1 and guide approx. 50 mm (2 in) of one of the strapping band ends through one of the two strapping band locks and into the buckle. Then guide the protective flap over this strapping band end and lock in place.
5. Position strapping band 1 as perpendicular as possible to the measuring pipe axis without twisting it.
6. Guide the second strapping band end through the strapping band lock that is still free and proceed in the same way as for the first strapping band end. Guide the protective flap over the second strapping band end and lock in place.
7. Tighten strapping band 1 as tightly as possible by hand.
8. Set strapping band 1 to the desired position, ensuring that it is as perpendicular as possible to the measuring pipe axis.
9. Position the two strap bolts on strapping band 1, arranging them at a half circumference in relation to one another (180° arrangement, e.g. clock hands positioned at 7:30 and 1:30) or quarter circumference (90° arrangement, e.g. clock hands positioned at 10 o’clock and 7 o’clock).

10. Tighten strapping band 1 so that it cannot slip.

11. Strapping band 2: proceed as for strapping band 1 (steps 4 to 8).

12. Only slightly tighten strapping band 2 for final mounting so that it can still be adjusted. The distance/offset from the center of strapping band 2 to the center of strapping band 1 is indicated by the sensor distance of the device.

13. Align strapping band 2 so that it is perpendicular to the measuring pipe axis and parallel to strapping band 1.

14. Position the two strap bolts on strapping band 2 on the measuring pipe so they are parallel to one another and offset at the same height/clock position (e.g. 10 and 4 o’clock) in relation to the two strap bolts on strapping band 1. A line drawn on the measuring pipe wall that is parallel to the measuring pipe axis can be helpful here. Now set the distance between the center of the strap bolts at the same level so that it exactly matches the sensor distance. An alternative method is to use the wire length → 33.

15. Tighten strapping band 2 so that it cannot slip.

**WARNING**

Risk of injury!
- To avoid sharp edges, trim the cut edges after shortening the strapping bands. Wear suitable gloves and protective goggles.

![](image.png)

**Diagram:**
- **Holder with strapping bands (large nominal diameters)**
- **Strap bolt with guide**
- **Strapping band**
- **Tensioning screw**

*The distance between the strap bolt and strapping band lock must be at least 500 mm (20 in).*

- For 1-traverse mounting with 180° (opposite) → 4, 7 (single-path measurement, A0044304), → 8, 8 (two-path measurement, A0043168)
- For 2-traverse mounting → 5, 7 (single-path measurement, A0044305), → 9, 8 (two-path measurement, A0043309)
- Electrical connection
Sensor holder with welded bolts

Can be used for
- Measuring devices with measuring range DN 50 to 4000 (2 to 160")
- Mounting on pipes DN 50 to 4000 (2 to 160")

Procedure:
- The welded bolts must be fixed at the same installation distances as the mounting bolts with strapping bands. The following sections explain how to align the mounting bolts, depending on the mounting method and measurement method:
  - Installation for measurement via 1 traverse → 33
  - Installation for measurement via 2 traverses → 35
- The sensor holder is secured as standard with a locking nut with a metric M6 ISO thread. If another thread should be used for fastening purposes, a sensor holder with a detachable locking nut must be used.

Sensor installation – small nominal diameters DN 15 to 65 (½ to 2½“)

Requirements
- The installation clearance is known → 26
- The sensor holder is pre-installed

Material
The following material is required for mounting:
- Sensor incl. adapter cable
- Sensor cable for connecting to the transmitter
- Coupling medium (coupling pad or coupling gel) for an acoustic connection between the sensor and pipe
Procedure:

1. Set the distance between the sensors to the value determined for the sensor distance. Press the movable sensor down slightly to move it.

2. Stick the coupling pad under the sensor to the measuring pipe or coat the contact surfaces of the sensor (b) with an even layer of coupling gel (approx. 0.5 to 1 mm (0.02 to 0.04 in)).

3. Fit the sensor housing on the sensor holder.
4. Lock the bracket in place to fix the sensor housing on the sensor holder.

5. Connect the sensor cable to the adapter cable.

This completes the mounting procedure. The sensors can now be connected to the transmitter via the connecting cables.

- The visible measuring pipe surface must be clean (free from flaking paint and/or rust) to ensure good acoustic contact.
- If necessary, the holder and sensor housing can be secured with a screw/nut or a lead seal (not supplied).
- The bracket can only be released using an auxiliary tool (e.g. screwdriver).

Sensor installation – medium/large nominal diameters DN 50 to 4000 (2 to 160")

Installation for measurement via 1 traverse

Requirements
- The installation clearance and wire length are known → 26
- Strapping bands are pre-installed

Material
The following material is required for mounting:
- Two strapping bands incl. mounting bolts and centering plates where necessary (already pre-installed → 28, → 29)
- Two measuring wires, each with a cable lug and a fixer to fix the strapping bands
- Two sensor holders
- Coupling medium (coupling pad or coupling gel) for an acoustic connection between the sensor and pipe
- Two sensors incl. connecting cables

Installation is unproblematic up to DN 400 (16"), as of DN 400 (16") check the distance and angle (180°) diagonally with the wire length.

Procedure:
1. Prepare the two measuring wires: arrange the cable lugs and fixer such that the distance they are apart corresponds to the wire length (SL). Screw the fixer onto the measuring wire.
2. With measuring wire 1: fit the fixer over the mounting bolt of strapping band 1 that is already securely mounted. Run measuring wire 1 clockwise around the measuring pipe. Fit the cable lug over the mounting bolt of strapping band 2 that can still be moved.

3. With measuring wire 2: fit the cable lug over the mounting bolt of strapping band 1 that is already securely mounted. Run measuring wire 2 counterclockwise around the measuring pipe. Fit the fixer over the mounting bolt of strapping band 2 that can still be moved.

4. Take the still movable strapping band 2, incl. the mounting bolt, and move it until both measuring wires are evenly tensioned and then tighten strapping band 2 so that it cannot slip. Then check the sensor distance from the center of the strapping bands. If the distance is too small, release strapping band 2 again and position it better. Both strapping bands should be as perpendicular as possible to the measuring pipe axis and parallel to one another.

5. Loosen the screws of the fixers on the measuring wires and remove the measuring wires from the mounting bolt.

6. Fit the sensor holders over the individual mounting bolts and tighten securely with the locking nut.

7. Apply the coupling pad to the sensors with the adhesive side facing down (→ 60). Alternatively coat the contact surfaces with an even layer of coupling gel (approx. 1 mm (0.04 in)). going from the groove through the center to the opposite edge.

8. Insert the sensor into the sensor holder.
9. Fit the sensor cover on the sensor holder and turn until the sensor cover engages with a click and the arrows (▴ / ▾ "close") are pointing towards one another.

10. Insert the sensor cable into the sensor until the end stop.

The sensors can now be connected to the transmitter via the sensor cables and the error message can be checked in the sensor check function. This completes the mounting procedure.

- The visible measuring pipe surface must be clean (free from flaking paint and/or rust) to ensure good acoustic contact.
- If the sensor is removed from the measuring pipe, it must be cleaned and new coupling gel applied (if there is no coupling pad).
- On rough measuring pipe surfaces, the gaps in the rough surface must be filled with sufficient amounts of coupling gel if the use of the coupling pad does not suffice (installation quality check).

**Installation for measurement via 2 traverses**

**Requirements**
- The installation clearance is known → 26
- Strapping bands are pre-installed

**Material**
The following material is required for mounting:
- Two strapping bands incl. mounting bolts and centering plates where necessary (already pre-installed → 28, → 29)
- A mounting rail to position the strapping bands:
  - Short rail up to DN 200 (8"
  - Long rail up to DN 600 (24"
- No rail > DN 600 (24"), as distance measured by sensor distance between the mounting bolts
- Two mounting rail holders
- Two sensor holders
- Coupling medium (coupling pad or coupling gel) for an acoustic connection between the sensor and pipe
- Two sensors incl. connecting cables
- Open-ended wrench (13 mm)
- Screwdriver
Procedure:

1. Position the strapping bands using the mounting rail [only DN50 to 600 (2 to 24")], for larger nominal diameters, measure the distance between the center of the strap bolts directly: Fit the mounting rail with the bore identified by the letter (from the Result sensor distance / measuring aid parameter) over the mounting bolt of strapping band 1 that is fixed in place. Position the adjustable strapping band 2 and fit the mounting rail with the bore identified by the numerical value over the mounting bolt.

2. Tighten strapping band 2 so that it cannot slip.

3. Remove the mounting rail from the mounting bolt.

4. Fit the sensor holders over the individual mounting bolts and tighten securely with the locking nut.

5. Apply the coupling pad to the sensors with the adhesive side facing down (→ 38). Alternatively coat the contact surfaces with an even layer of coupling gel (approx. 1 mm (0.04 in)), going from the groove through the center to the opposite edge.

6. Insert the sensor into the sensor holder.

7. Fit the sensor cover on the sensor holder and turn until the sensor cover engages with a click and the arrows (▲ / ▼ "close") are pointing towards one another.
8. Insert the sensor cable into the sensor until the end stop and tighten the union nut.

![Image of sensor installation](image)

**39 Mounting the sensor and connecting the sensor cable**

The sensors can now be connected to the transmitter via the sensor cables and the error message can be checked in the sensor check function. This completes the mounting procedure.

- The visible measuring pipe surface must be clean (free from flaking paint and/or rust) to ensure good acoustic contact.
- If the sensor is removed from the measuring pipe, it must be cleaned and new coupling gel applied (if there is no coupling pad).
- On rough measuring pipe surfaces, the gaps in the rough surface must be filled with sufficient amounts of coupling gel if the use of the coupling pad does not suffice (installation quality check).

---

In principle, it is permitted to insulate the sensors mounted on the pipe. In the case of insulated sensors, make sure that the process temperature does not exceed or drop below the specified cable temperature.

- If operating outdoors:
  Avoid direct sunlight, particularly in warm climatic regions.

---

**Storage temperature**

The storage temperature for all components (except display modules) corresponds to the ambient temperature range → 38.
Degree of protection

Transmitter
- IP66/67, Type 4X enclosure, suitable for pollution degree 4
- When the housing is open: IP20, Type 1 enclosure, suitable for pollution degree 2
- Display module: IP20, Type 1 enclosure, suitable for pollution degree 2

Sensor
- Standard: IP66/67, Type 4X enclosure, suitable for pollution degree 4
- Optionally available: IP68, Type 6P enclosure, suitable for pollution degree 4

External WLAN antenna
- IP67

Vibration- and shock-resistance

Vibration sinusoidal, according to IEC 60068-2-6
- 2 to 8.4 Hz, 7.5 mm peak
- 8.4 to 2,000 Hz, 2 g peak for transmitter, 1 g peak for sensor

Vibration broad-band random, according to IEC 60068-2-64
- 10 to 200 Hz, 0.01 g²/Hz
- 200 to 2,000 Hz, 0.003 g²/Hz
- Total: 2.70 g rms

Shock half-sine, according to IEC 60068-2-27
- 6 ms 50 g

Rough handling shocks according to IEC 60068-2-31

Electromagnetic compatibility (EMC)
- As per IEC/EN 61326
- Complies with emission limits for industry as per EN 55011 (Class A)

Details are provided in the Declaration of Conformity.

Sensor - transmitter cable

> UV rays can impair the cable outer sheath. Protect the cable from exposure to sun as much as possible.

DN 15 to 65 (½ to 2½”):
- Sensor cable: TPE
- Cable sheath: TPE
- Cable plug: nickel-plated brass

DN 50 to 4000 (2 to 160”):
- Sensor cable, TPE halogen-free
- Cable sheath: TPE halogen-free
- Cable plug: nickel-plated brass
- Sensor cable PTFE
- Cable sheath: PTFE
- Cable plug: stainless steel 1.4301 (304), 1.4404 (316L)

Ultrasonic transducer

- Holder: stainless steel 1.4301 (304), 1.4404 (316L)
- Housing: stainless steel 1.4301 (304), 1.4404 (316L)
- Strapping bands/bracket: stainless steel 1.4301 (304), 1.4404 (316L)
- Contact surfaces: chemically stable plastic

Accessories

External WLAN antenna

- Antenna: ASA plastic (acrylic ester-styrene-acrylonitrile) and nickel-plated brass
- Adapter: Stainless steel and nickel-plated brass
- Cable: Polyethylene
- Plug: Nickel-plated brass
- Angle bracket: Stainless steel

Operability

Operating concept

Operator-oriented menu structure for user-specific tasks

- Commissioning
- Operation
- Diagnostics
- Expert level

Fast and safe commissioning

- Guided menus ('Make-it-run' wizards) for applications
- Menu guidance with brief descriptions of the individual parameter functions
- Access to the device via Web server
- WLAN access to the device via mobile handheld terminal, tablet or smart phone
Reliable operation
- Operation in local language
- Uniform operating philosophy applied to device and operating tools
- If replacing electronic modules, transfer the device configuration via the integrated memory (HistoROM backup) which contains the process and measuring device data and the event logbook. No need to reconfigure.

Efficient diagnostic behavior increases measurement availability
- Troubleshooting measures can be called up via the device and in the operating tools
- Diverse simulation options, logbook for events that occur and optional line recorder functions

Installation quality
To optimize the sensor mounting positions, real-time display of:
- Installation status (good, bad, acceptable)
- Signal strength
- Signal to noise ratio
- Sound velocity

Languages
Can be operated in the following languages:
- Via local operation:
  - English, German, French, Spanish, Italian, Dutch, Portuguese, Polish, Russian, Turkish, Chinese, Japanese, Bahasa (Indonesian), Vietnamese, Czech, Swedish
- Via 'FieldCare', 'DeviceCare' operating tool:
  - English, German, French, Spanish, Italian, Chinese, Japanese
- Via Web browser (only available for device versions with HART, PROFIBUS DP and EtherNet/IP):
  - English, German, French, Spanish, Italian, Dutch, Portuguese, Polish, Russian, Turkish, Chinese, Japanese, Bahasa (Indonesian), Vietnamese, Czech, Swedish

Local operation

Via display module

Equipment:
- Standard features 4-line, illuminated, graphic display; touch control
- Order code for 'Display; operation', option G '4-line, illuminated; Touch Control +WLAN' offers standard equipment features in addition to access via Web browser

Information about WLAN interface → 50

Display elements
- 4-line, illuminated, graphic display
- White background lighting; switches to red in event of device errors
- Format for displaying measured variables and status variables can be individually configured
- Permitted ambient temperature for the display: −20 to +60 °C (−4 to +140 °F)
  The readability of the display may be impaired at temperatures outside the temperature range.

Operating elements
- External operation via touch control (3 optical keys) without opening the housing: 0, ▼, ▲
- Operating elements also accessible in the various zones of the hazardous area
Remote operation

Via HART protocol

This communication interface is available in device versions with a HART output.

<table>
<thead>
<tr>

Service interface

Via service interface (CDI-RJ45)

This communication interface is present in the following device version:
- Order code for "Output", option H: 4 to 20 mA HART, pulse/frequency output, switch output
- Order code for "Output", option I: 4 to 20 mA HART, 2 x pulse/frequency/switch output, status input

Via WLAN interface

The optional WLAN interface is available on the following device version:
Order code for "Display; operation", option G "4-line, illuminated; touch control + WLAN"
1 Transmitter with integrated WLAN antenna
2 LED lit constantly: WLAN reception is enabled on measuring device
3 LED flashing: WLAN connection established between operating unit and measuring device
4 Computer with WLAN interface and Web browser (e.g. Microsoft Internet Explorer, Microsoft Edge) for accessing the integrated device Web server or with operating tool (e.g. FieldCare, DeviceCare)
5 Mobile handheld terminal with WLAN interface and Web browser (e.g. Microsoft Internet Explorer, Microsoft Edge) for accessing the integrated device Web server or operating tool (e.g. FieldCare, DeviceCare)
6 Smart phone or tablet (e.g. Field Xpert SMT70)

**Supported operating tools**

Different operating tools can be used for local or remote access to the measuring device. Depending on the operating tool used, access is possible with different operating units and via a variety of interfaces.

<table>
<thead>
<tr>
<th>Supported operating tools</th>
<th>Operating unit</th>
<th>Interface</th>
<th>Additional information</th>
</tr>
</thead>
</table>
| Web browser               | Notebook, PC or tablet with Web browser | • CDI-RJ45 service interface  
• WLAN interface            | Special Documentation for the device |
| DeviceCare SFE100         | Notebook, PC or tablet with Microsoft Windows system | • CDI-RJ45 service interface  
• WLAN interface  
• Fieldbus protocol       | 58 |
Other operating tools based on FDT technology with a device driver such as DTM/iDTM or DD/DDD can be used for device operation. These operating tools are available from the individual manufacturers. Integration into the following operating tools, among others, is supported:

- FactoryTalk AssetCentre (FTAC) from Rockwell Automation → www.rockwellautomation.com
- Process Device Manager (PDM) from Siemens → www.siemens.com
- Asset Management Solutions (AMS) from Emerson → www.emersonprocess.com
- FieldCommunicator 375/475 from Emerson → www.emersonprocess.com
- Field Device Manager (FDM) from Honeywell → www.honeywellprocess.com
- FieldMate from Yokogawa → www.yokogawa.com
- PACTWare → www.pactware.com

The related device description files are available: www.endress.com → Downloads

**Web server**

Thanks to the integrated Web server the device can be operated and configured via a Web browser and via a standard Ethernet switch (RJ45) or via a WLAN interface. The structure of the operating menu is the same as the menu on the local display. In addition to the measured values, status information about the device is also displayed and allows the user to monitor the status of the device. Furthermore the device data can be managed and the network parameters can be configured.

A device that has a WLAN interface (can be ordered as an option) is required for the WLAN connection: order code for "Display", option G '4-line, illuminated; Touch Control +WLAN'. The device acts as an Access Point and enables communication by computer or a mobile handheld terminal.

**Supported functions**

Data exchange between the operating unit (such as a notebook for example) and the measuring device:

- Upload the configuration from the measuring device (XML format, create configuration back-up)
- Save the configuration to the measuring device (XML format, restore configuration)
- Export event list (.csv file)
- Export parameter settings (.csv file or PDF file, document the measuring point configuration)
- Export the Heartbeat verification log (PDF file, only available with the "Heartbeat Verification" application package)
- Flash firmware version for device firmware upgrade, for instance
- Download driver for system integration
- Display up to 1000 saved measured values (only available with the Extended HistoROM application package → § 55)

**HistoROM data management**

The measuring device features HistoROM data management. HistoROM data management comprises both the storage and import/export of key device and process data, making operation and servicing far more reliable, secure and efficient.
Additional information on the data storage concept

There are different types of data storage units in which device data are stored and used by the device:

<table>
<thead>
<tr>
<th></th>
<th>HistoROM backup</th>
<th>T-DAT</th>
<th>S-DAT</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Available data</strong></td>
<td>• Event logbook such as diagnostic events for example</td>

<tr>
<td><strong>Storage location</strong></td>
<td>Fixed on the user interface board in the connection compartment</td>
<td>Attachable to the user interface board in the connection compartment</td>
<td>Fixed on the sensor connection board</td>
</tr>
</tbody>
</table>

Data backup

**Automatic**

- The most important device data (sensor and transmitter) are automatically saved in the DAT modules
- If the transmitter or measuring device is replaced: once the T-DAT containing the previous device data has been exchanged, the new measuring device is ready for operation again immediately without any errors
- If the sensor is replaced: once the sensor has been replaced, new sensor data are transferred from the S-DAT in the measuring device and the measuring device is ready for operation again immediately without any errors

Data transmission

**Manual**

Transfer of a device configuration to another device using the export function of the specific operating tool, e.g. with FieldCare, DeviceCare or Web server: to duplicate the configuration or to store in an archive (e.g. for backup purposes)

Event list

**Automatic**

- Chronological display of up to 20 event messages in the events list
- If the Extended HistoROM application package (order option) is enabled: up to 100 event messages are displayed in the events list along with a time stamp, plain text description and remedial measures
- The events list can be exported and displayed via a variety of interfaces and operating tools e.g. DeviceCare, FieldCare or Web server

Data logging

**Manual**

If the Extended HistoROM application package (order option) is enabled:

- Record up to 1,000 measured values via 1 to 4 channels
- User configurable recording interval
- Record up to 250 measured values via each of the 4 memory channels
- Export the measured value log via a variety of interfaces and operating tools e.g. FieldCare, DeviceCare or web server

Certificates and approvals

Current certificates and approvals for the product are available via the Product Configurator at www.endress.com.

1. Select the product using the filters and search field.
2. Open the product page.

The Configuration button opens the Product Configurator.

Ordering information

Detailed ordering information is available for your nearest sales organization www.addresses.endress.com or in the Product Configurator under www.endress.com:

1. Click Corporate
2. Select the country
3. Click Products
4. Select the product using the filters and search field
5. Open the product page

The Configuration button to the right of the product image opens the Product Configurator.

Product Configurator - the tool for individual product configuration

- Up-to-the-minute configuration data
- Depending on the device: Direct input of measuring point-specific information such as measuring range or operating language
- Automatic verification of exclusion criteria
- Automatic creation of the order code and its breakdown in PDF or Excel output format
- Ability to order directly in the Endress+Hauser Online Shop

Application packages

Many different application packages are available to enhance the functionality of the device. Such packages might be needed to address safety aspects or specific application requirements.

The application packages can be ordered with the device or subsequently from Endress+Hauser. Detailed information on the order code in question is available from your local Endress+Hauser sales center or on the product page of the Endress+Hauser website: www.endress.com.

Heartbeat Technology

<table>
<thead>
<tr>
<th>Package</th>
<th>Description</th>
</tr>
</thead>
</table>
| Heartbeat Verification +Monitoring | **Heartbeat Verification**  
Meets the requirement for traceable verification to DIN ISO 9001:2008  
Chapter 7.6 a) "Control of monitoring and measuring equipment":  
• Functional testing in the installed state without interrupting the process.  
• Traceable verification results on request, including a report.  
• Simple testing process via local operation or other operating interfaces.  
• Clear measuring point assessment (pass/fail) with high test coverage within the framework of manufacturer specifications.  
• Extension of calibration intervals according to operator's risk assessment.  
**Heartbeat Monitoring**  
Continuously supplies data, which are characteristic of the measuring principle, to an external condition monitoring system for the purpose of preventive maintenance or process analysis. These data enable the operator to:  
• Draw conclusions - using these data and other information - about the impact the measuring application has on the measuring performance over time.  
• Schedule servicing in time.  
• Monitor the process or product quality, e.g. gas pockets. |

FlowDC
