

Special Documentation

Hygiene certificates

Level and pressure measuring devices

1 Hygiene certificates for level and pressure measuring devices

A0044871

1 Hygiene approval symbols → 3-A SSI, EHEDG EL, EHEDG ED

- 3-A SSI and EHEDG TYPE EL - Class I: Deltapilot, Cerabar, Ceraphant, Deltabar, Levelflex, Liquicap, Micropilot, Liquiphant, Lquitrend
- 3-A SSI and EHEDG TYPE ED - Class I: Nivector

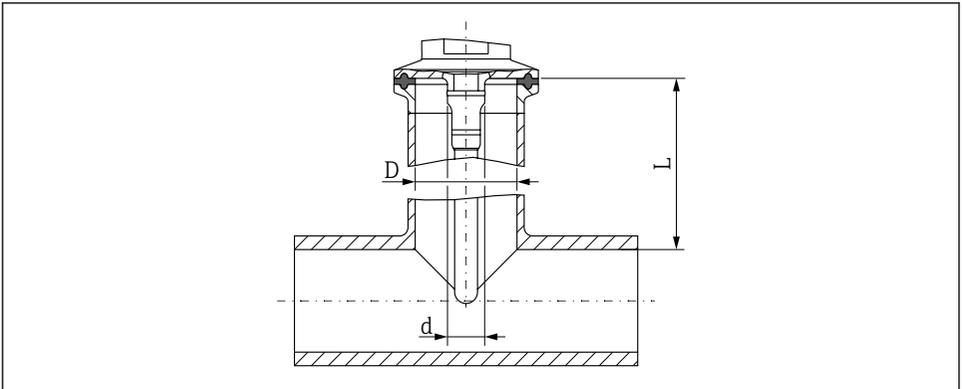

2 Installation instructions

For EHEDG:

- Install the sensors according to the instructions given in EHEDG documents 8, 10 and 37. Mount the sensor, for example, in a self-draining orientation, which means that the angles will be chosen in such a way that liquids can drain completely by gravity alone. In tanks the cleaning device must be positioned in such a way that the sensor is perfectly cleaned.
- If cleaning in place (CIP) is required, process adapters are available that meet the requirements outlined in the EHEDG position paper. If installing horizontally, ensure that the leakage hole points downwards. This ensures that any leaks can be detected as quickly as possible.
- Preferably do not mount on a T-piece because of the difficult to clean dead end. If mounting on a T-piece is unavoidable, please observe the EHEDG installation guidelines for mounting on a T-piece; the ratio between the depth of the T-piece (L) and the diameter (D and d) must be $L/(D-d) < 1$ (see the EHEDG Position Paper). If the sensors are flat, the additional diameter "d" given in the position paper is not applicable; then the ratio must be $L/D < 1$, see drawing.
- In case the sensor is applied in a tank wall the surface must be flush finished.
- Suitable pipe couplings and process connections (including special gaskets/seals) must be applied. For EHEDG applications, these shall be according to the most recent version of the EHEDG Position Paper (see the EHEDG website www.ehedg.org).
- Applied seals must be approved for food contact. For example, they must have an approval according to the applicable legislation.
- The sensors are suitable for cleaning-in-place (CIP) and sterilization-in-place (SIP) without dismantling (class I equipment), so during cleaning, the sensor must not be dismantled. The maximum allowable pressure and temperature for each sensor shall not be exceeded. See the respective "Technical Information" document for specifications.

For 3-A:

- Preferably do not mount on a T-piece because of the difficult to clean dead end. If mounting on a T-piece is unavoidable, please note that the ratio between the depth of the T-piece (L) and the diameter (D and d) must be $L/(D-d) < 2$ in accordance with 3-A Standard 00 - XX. If the sensors are flat, the additional diameter "d" given is not applicable; then the ratio must be $L/D < 2$, see drawing.
- If cleaning in place (CIP) is required, process adapters are available that meet the 3-A requirements. If installing horizontally, ensure that the leakage hole points downwards. This ensures that any leaks can be detected as quickly as possible.
- Mount the sensor in a self-draining orientation, for example, which means that the angles will be chosen in such a way that fluids can be drained completely by gravity alone. In tanks the cleaning device must be positioned in such a way that the sensor is perfectly cleaned.
- Applied seals must be approved for food contact. For example, they must have an approval according to the applicable legislation.
- The sensors are suitable for cleaning-in-place (CIP) and sterilization-in-place (SIP) without dismantling (class I equipment), so during cleaning, the sensor must not be dismantled. The maximum allowable pressure and temperature for each sensor shall not be exceeded. See the respective "Technical Information" document for specifications.
- The wetted materials meet the requirements of FDA and 3-A-Sanitary Standard No. 74-XX. Endress+Hauser confirms this by affixing the 3-A sign to the device.
- For 3-A applications, DIN 11851 connections shall be fitted with suitable gaskets in order to meet the 3-A requirements in Std. 63-XX and CCE Bulletin 2011-3. For instance, the gasket system from Siersema Componenten System (S.K.S.) B.V., the Netherlands, or ASEPTO-STAR k-flex gasket from Kieselmann GmbH, Germany, can be used.

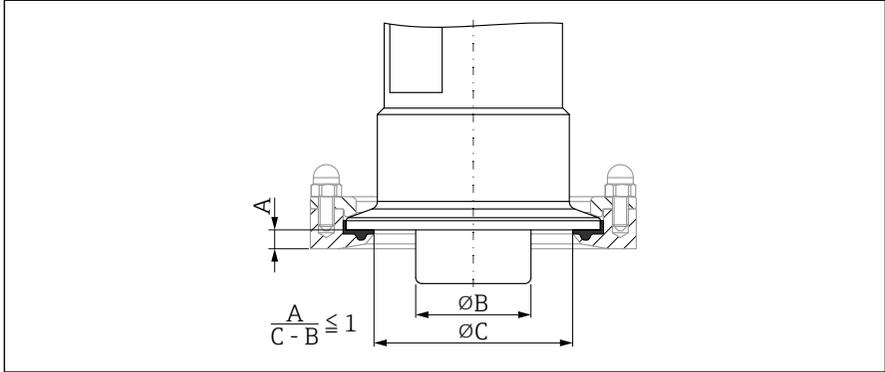

A0041791

2 Relevant information for T-piece installation

Additional information for Nivector FTI26

Installation in a conventional T-piece or in a metal tank nozzle impacts the measuring performance of the sensor.

- ▶ The Tri-Clamp version can be installed for a hygiene-compliant connection, e.g. the NA Connect adapter.
 - ↳ This minimizes dead legs and increases cleanability.

- 3 Installation with Tri-Clamp, which can be ordered as an accessory, and with NA Connect adapter provided by customer

- A Distance between Tri-Clamp and NA Connect adapter
 B Diameter of Nivector
 C Diameter of NA Connect adapter

- Install the sensors according to the directions given in EHEDG documents 8 and 37. For example, mount the sensor in a self-draining orientation, which means that the angles will be chosen in such a way that the product can be drained completely by gravity.
- For EHEDG applications, the Nivector FTI26 is only certified for dry cleaning. Under the described installation conditions, the sensor is cleaned together with the tank.

3 Certified devices

Explanation of the table headers:

- **A:** Option in the product structure
- **B:** Description of the option
