Technical Information
TR13, TC13

Modular thermometer with extension neck, thermowell and flange

TR13 with resistance insert (RTD)
TC13 with thermocouple insert (TC)

Application
- Universal range of application
- Measuring range:
  - Resistance insert (RTD): –200 to 600 °C (–328 to 1112 °F)
  - Thermocouple (TC): –40 to 1100 °C (–40 to 2012 °F)
- Pressure range up to 100 bar (1450 psi)
- Degree of protection: up to IP 68

Head transmitter
All Endress+Hauser transmitters are available with enhanced accuracy and reliability compared to directly wired sensors. Easy customizing by choosing one of the following outputs and communication protocols:
- Analog output 4 to 20 mA
- HART®
- PROFIBUS® PA
- FOUNDATION Fieldbus™

Your benefits
- High degree of flexibility thanks to modular design with standard terminal heads as per DIN EN 50446 and customer-specific immersion lengths
- High degree of insert compatibility and design as per DIN 43772
- Extension neck to protect the head transmitter from overheating
- Fast response time with reduced/tapered tip form
- Types of protection for use in hazardous locations:
  - Intrinsic Safety (Ex ia)
  - Non-sparking (Ex nA)

Function and system design

<table>
<thead>
<tr>
<th>Measuring principle</th>
<th>Resistance thermometer (RTD)</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>These resistance thermometers use a Pt100 temperature sensor according to IEC 60751. The temperature sensor is a temperature-sensitive platinum resistor with a resistance of 100 Ω at 0 °C (32 °F) and a temperature coefficient $\alpha = 0.003851 , ^\circ C^{-1}$.</td>
</tr>
<tr>
<td></td>
<td><strong>There are generally two different kinds of platinum resistance thermometers:</strong></td>
</tr>
<tr>
<td></td>
<td>• <strong>Wire wound (WW):</strong> Here, a double coil of fine, high-purity platinum wire is located in a ceramic support. This is then sealed top and bottom with a ceramic protective layer. Such resistance thermometers not only facilitate very reproducible measurements but also offer good long-term stability of the resistance/temperature characteristic within temperature ranges up to 600 °C (1,112 °F). This type of sensor is relatively large in size and it is comparatively sensitive to vibrations.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Thin film platinum resistance thermometers (TF):</strong> A very thin, ultrapure platinum layer, approx. 1 μm thick, is vaporized in a vacuum on a ceramic substrate and then structured photolithographically. The platinum conductor paths formed in this way create the measuring resistance. Additional covering and passivation layers are applied and reliably protect the thin platinum layer from contamination and oxidation, even at high temperatures.</td>
</tr>
<tr>
<td></td>
<td>The primary advantages of thin film temperature sensors over wire wound versions are their smaller sizes and better vibration resistance. A relatively low principle-based deviation of the resistance/temperature characteristic from the standard characteristic of IEC 60751 can frequently be observed among TF sensors at high temperatures. As a result, the tight limit values of tolerance category A as per IEC 60751 can only be observed with TF sensors at temperatures up to approx. 300 °C (572 °F).</td>
</tr>
</tbody>
</table>

**Thermocouples (TC)**

Thermocouples are comparatively simple, robust temperature sensors which use the Seebeck effect for temperature measurement: if two electrical conductors made of different materials are connected at a point, a weak electrical voltage can be measured between the two open conductor ends if the conductors are subjected to a thermal gradient. This voltage is called thermoelectric voltage or electromotive force (emf.). Its magnitude depends on the type of conducting materials and the temperature difference between the "measuring point" (the junction of the two conductors) and the "cold junction" (the open conductor ends). Accordingly, thermocouples primarily only measure differences in temperature. The absolute temperature at the measuring point can be determined from these if the associated temperature at the cold junction is known or is measured separately and compensated for. The material combinations and associated thermoelectric voltage/temperature characteristics of the most common types of thermocouple are standardized in the IEC 60584 and ASTM E230/ANSI MC96.1 standards.
Measuring system

![Diagram of Measuring System]

1. Application example
   A Mounted thermometer with head transmitter installed.
   B RIA16 field display unit - The display unit records the analog measuring signal from the head transmitter and shows this on the display. The LC display shows the current measured value in digital form and as a bar graph indicating a limit value violation. The display unit is looped into the 4 to 20 mA circuit and gets the required energy from there. More information on this can be found in the Technical Information (see “Documentation”).
   C RN22: 1- or 2-channel active barrier for the separation of 0/4 to 20 mA standard signal circuits, optionally available as a signal doubler, 24 V DC. HART-transparent

2. Thermometer design
   1 Insert with mounted head transmitter (example with Ø3 mm (0.12 in))
   2 Insert with mounted ceramic terminal block (example with Ø6 mm (0.24 in))
   3 Terminal head
   4 Thermowell
   5 Process connection: flange
   6 Various types of tip - for detailed information, see Section “Shape of tip”:
      6a Reduced or tapered for inserts with Ø3 mm (0.12 in)
      6b Straight or tapered for inserts with Ø6 mm (0.24 in)
   7 Protective sheath
   E Extension neck length
   L Immersion length
   IL Insertion length

The TR13 and TC13 thermometers have a modular design. The terminal head is used as a connection module for the mechanical and electrical connection of the insert. The position of the actual thermometer sensor in the insert ensures that it is mechanically protected. The insert can be replaced or calibrated without interrupting the process. Either ceramic terminal blocks or transmitters can be fitted to the internal terminal block.

</table>

1) It is recommended to use a 3- or 4-wire measurement. If using a 2-wire measurement the resistance of the wires will influence the measured value.

Values are valid for single wire resistance and ambient temperature at 20 °C (68 °F)
Output

Output signal
Generally, the measured value can be transmitted in one of two ways:

- Directly-wired sensors - sensor measured values forwarded without a transmitter.
- By selecting the corresponding Endress+Hauser iTEMP temperature transmitter via all common protocols. All the transmitters listed below are mounted directly in the terminal head and wired with the sensory mechanism.

Family of temperature transmitters
Thermometers fitted with iTEMP transmitters are an installation-ready complete solution to improve temperature measurement by significantly increasing accuracy and reliability, when compared to direct wired sensors, as well as reducing both wiring and maintenance costs.

4 to 20 mA head transmitters
They offer a high degree of flexibility, thereby supporting universal application with low inventory storage. The iTEMP transmitters can be configured quickly and easily at a PC. Endress+Hauser offers free configuration software which can be downloaded from the Endress+Hauser Website. More information can be found in the Technical Information.

HART® head transmitters
The transmitter is a 2-wire device with one or two measuring inputs and one analog output. The device not only transfers converted signals from resistance thermometers and thermocouples, it also transfers resistance and voltage signals using HART® communication. Swift and easy operation, visualization and maintenance using universal device configuration tools like FieldCare, DeviceCare or FieldCommunicator 375/475. Integrated Bluetooth® interface for the wireless display of measured values and configuration via E+H SmartBlue (app), optional. For more information, see the Technical Information.

PROFIBUS® PA head transmitters
Universally programmable head transmitter with PROFIBUS® PA communication. Conversion of various input signals into digital output signals. High accuracy over the complete ambient temperature range. The configuration of PROFIBUS PA functions and of device-specific parameters is performed via fieldbus communication. For more information, see the Technical Information.

FOUNDATION Fieldbus™ head transmitters
Universally programmable head transmitter with FOUNDATION Fieldbus™ communication. Conversion of various input signals into digital output signals. High accuracy over the complete ambient temperature range. All transmitters are released for use in all important process control systems. The integration tests are performed in Endress+Hauser's 'System World'. For more information, see the Technical Information.

Advantages of the iTEMP transmitters:
- Dual or single sensor input (optionally for certain transmitters)
- Pluggable display (optionally for certain transmitters)
- Unsurpassed reliability, accuracy and long-term stability in critical processes
- Mathematical functions
- Monitoring of the thermometer drift, sensor backup functionality, sensor diagnostic functions
- Sensor-transmitter matching for dual sensor input transmitters, based on Callendar–Van-Dusen-coefficients (CvD).

Energy supply
Type of sensor connection RTD
3  Terminal block mounted
1  3-wire, single
2  2 x 3-wire, single
3  4-wire, single
4  Outside screw

4  Head mounted transmitter TMT18x (single sensor input)
1  Power supply, head transmitter and analog output 4 to 20 mA or fieldbus connection
2  RTD, 3-wire
3  RTD, 4-wire

Only available with screw terminals

5  Head mounted transmitter TMT8x (dual sensor input)
1  Sensor input 1, RTD: 4- and 3-wire
2  Sensor input 2, RTD: 3-wire
3  Power supply or fieldbus connection
4  Display connection

Type of sensor connection thermocouple (TC)
6 Terminal block mounted

<td>Type N: orange (+), red (-)</td>
</tr>
</tbody>
</table>

#### Cable entries

See "Terminal heads" section

The cable entries must be selected during device configuration. Different terminal heads offer different options in terms of the thread and number of available cable entries.

#### Connectors

Endress+Hauser offers a wide variety of connectors for the simple and fast integration of the thermometer into a process control system. The following tables show the PIN assignments of the various plug connector combinations.

We advise against connecting thermocouples directly to connectors. The direct connection to the pins of the plug might generate a new ‘thermocouple’ which influences the accuracy of the measurement. Therefore we do not connect thermocouples directly to connectors. The thermocouples are connected in conjunction with a transmitter.

**PIN position and color code**

1) Second Pt100 is not connected
2) If a head is used without grounding screw, e.g. plastic housing TA30S or TA30P, insulated Y instead of grounded GND

### Overvoltage protection

To protect against overvoltage in the power supply and signal/communication cables for the thermometer electronics, Endress+Hauser offers the HAW562 surge arrester for DIN rail mounting and the HAW569 for field housing installation.

For more information see the Technical Information "HAW562 Surge arrester" TI01012K and "HAW569 Surge arrester" TI01013K.

</tbody>
</table>

Process pressure

The pressure values which the actual thermowell can be exposed to at the various temperatures and the maximum permitted flow velocity are illustrated in the figure below. The pressure loading capacity of the process connection can sometimes be considerably lower. The maximum permitted process pressure for a specific thermometer is derived from the lower pressure value of the thermowell and process connection.

7 Maximum permitted process pressure for pipe diameter

A Medium water \( T = 50 \, ^\circ \text{C} \) (122 °F)
B Medium superheated steam at \( T = 400 \, ^\circ \text{C} \) (752 °F)
L Immersion length
P Process pressure
--- Thermowell diameter 9 x 1 mm (0.35 in)
--- Thermowell diameter 12 x 2.5 mm (0.47 in)

Please note the restriction on the maximum process pressure to the flange pressure ratings specified in the table below.

<table>
<thead>
<tr>
<th>Process connection</th>
<th>Standard</th>
<th>Max. process pressure</th>
</tr>
</thead>
<tbody>
<tr>
<td>Flange</td>
<td>EN1092-1 or ISO 7005-1</td>

<td>DIN2526/7</td>
<td>PN40 at 20 °C (68 °F) depending on the flange pressure rating</td>
</tr>
</tbody>
</table>
Maximum flow velocity

The maximum flow velocity tolerated by the thermowell diminishes with increasing immersion of
the sensor in the liquid flow. See the figures below for more detailed information.

\[ v \text{ (ft/s)} \quad v \text{ (m/s)} \]

\[ L \text{ (mm)} \quad L \text{ (in)} \]

\[ v \text{ (ft/s)} \]

\[ v \text{ (m/s)} \]

B  Flow velocity depending on the immersion depth
A  Medium water at \( T = 50°C \) (122°F)
B  Medium superheated steam at \( T = 400°C \) (752°F)
L  Immersion length
v  Flow velocity

--- Thermowell diameter 9 x 1 mm (0.35 in)
--- Thermowell diameter 12 x 2.5 mm (0.47 in)

Shock and vibration resistance

The Endress+Hauser inserts meet the requirements of IEC 60751 which specify shock and vibration
resistance of 3g in the range 10 to 500 Hz.
The vibration resistance at the measuring point depends on the sensor type and design, see the following table:

<table>
<thead>
<tr>
<th>Version</th>
<th>Vibration resistance for the sensor tip</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pt100 (WW or TF)</td>
<td>30 m/s² (3g)¹) quick-release fastener</td>
</tr>
<tr>
<td>iTHERM® StrongSens Pt100 (TF)</td>
<td>&gt; 600 m/s² (60g) for sensor tip</td>
</tr>
<tr>
<td>iTHERM® QuickSens Pt100 (TF), version: Ø6 mm (0.24 in)</td>
<td></td>
</tr>
</tbody>
</table>

¹) Vibration resistance also valid for iTHERM QuickNeck

### Accuracy

Permissible deviation limits of thermoelectric voltages from standard characteristic for thermocouples as per IEC 60584 and ASTM E230/ANSI MC96.1:

<table>
<thead>
<tr>
<th>Standard</th>
<th>Type</th>
<th>Standard tolerance</th>
<th>Special tolerance</th>
</tr>
</thead>
<tbody>
<tr>
<td>IEC 60584</td>
<td>J (Fe-CuNi)</td>

Response time for the sensor assembly without transmitter.

**Insulation resistance**
- RTD:
  Insulation resistance according to IEC 60751 > 100 MΩ at 25 °C between terminals and sheath material measured with a minimum test voltage of 100 V DC
- TC:
  Insulation resistance according to IEC 1515 between terminals and sheath material with a test voltage of 500 V DC:
  - > 1 GΩ at 20 °C
  - > 5 MΩ at 500 °C

**Dielectric strength**
Tested at room temperature for 5 s:
- \( \varnothing \) 6: ≥ 1000 V DC between terminals and insert sheath
- \( \varnothing \) 3: ≥ 250 V DC between terminals and insert sheath

**Self heating**
RTD elements are passive resistances that are measured using an external current. This measurement current causes a self-heating effect in the RTD element itself which in turn creates an additional measurement error. In addition to the measurement current, the size of the measurement error is also affected by the temperature conductivity and flow velocity of the process. This self-heating error is negligible when an Endress+Hauser iTEMP temperature transmitter (very small measurement current) is connected.

**Calibration**
Endress+Hauser provides comparison temperature calibration from -80 to +1400 °C (−110 to +2552 °F) based on the International Temperature Scale (ITS90).
Calibrations are traceable to national and international standards. The calibration certificate is referenced to the serial number of the thermometer. Only the insert is calibrated.

Insert: ⌀6 mm (0.24 in) and 3 mm (0.12 in)

| AISI 316L/ 1.4404 1.4435 | X2CrNiMo17-12-2 X2CrNiMo18-14-3 | 650 °C (1202 °F) 1) | • Austenitic, stainless steel  
  • High corrosion resistance in general  
  • Particularly high corrosion-resistance in chlorine-based and acidic, non-oxidizing atmospheres through the addition of molybdenum (e.g. phosphoric and sulfuric acids, acetic and tartaric acids with a low concentration)  
  • Increased resistance to intergranular corrosion and pitting  
  • Compared to 1.4404, 1.4435 has even higher corrosion resistance and a lower delta ferrite content |
| AISI 316Ti/ 1.4571 | X6CrNiMoTi17-12-2 | 700 °C (1292 °F) 1) | • Properties comparable with AISI 316L  
  • The addition of titanium increases resistance to intergranular corrosion even after welding  
  • Broad range of uses in the chemical, petrochemical and oil industries as well as in coal chemistry  
  • Can only be polished to a limited extent, titanium streaks can form |
| Inconel 600/2.4816 | NiCr15Fe | 1100 °C (2012 °F) | • A nickel/chromium alloy with very good resistance to aggressive, oxidizing and reducing atmospheres, even at high temperatures  
  • Resistance to corrosion caused by chlorine gases and chlorinated media as well as many oxidizing mineral and organic acids, sea water etc.  
  • Corrosion from ultrapure water  
  • Not to be used in sulfur-containing atmospheres |
| Hastelloy C276/2.4819 | NiMo16Cr15W | 1100 °C (2012 °F) | • Nickel-based alloy with very good resistance to oxidizing and reducing atmospheres, even at high temperatures  
  • Particularly resistant to chlorine gas and chlorides as well as many oxidizing mineral and organic acids |

| PTFE (Teflon)     | Polytetrafluorethylene   | 100 °C (212 °F)                                        | • Resistance to almost all chemicals  
• High temperature resistance  
• Maximum permitted process pressure: < 2 bar (29 psi)                                                                                   |
| PVDF              | Polyvinylidene fluoride  | 80 °C (176 °F)                                         | • High stability  
• High creepage stability under continuous load  
• Good low-temperature properties                                                                                                           |
| Tantalum          | -                        | 250 °C (482 °F)                                        | • With the exception of hydrofluoric acid, fluorine and fluorides, excellent resistance to most mineral acids and saline solutions  
• Prone to oxidation and embrittlement at high temperatures in air                                                                             |

1) Can be used to a limited extent up to 800 °C (1472 °F) for low compressive loads and in non-corrosive media. Please contact your Endress+Hauser sales team for further information.
Installation

Orientation
No restrictions.

Installation instructions

The immersion length of the thermometer influences the accuracy. If the immersion length is too small, errors in the measurement are caused by heat conduction via the process connection and the container wall. For installation in a pipe, therefore, the recommended installation depth ideally corresponds to half of the pipe diameter. Installation at an angle (see C and D) could be another solution. When determining the immersion length or installation depth all the parameters of the thermometer and of the process to be measured must be taken into account (e.g. flow velocity, process pressure).

- Installation possibilities: Pipes, tanks or other plant components
- Recommended minimum immersion depth: 80 to 100 mm (3.15 to 3.94 in)
- The immersion length should correspond to at least 8 times the thermowell diameter. Example: thermowell diameter 12 mm (0.47 in) x 8 = 96 mm (3.8 in). We recommend a standard immersion depth of 120 mm (4.72 in).

- ATEX certification: Observe the installation instructions in the Ex documentation!
**Extension neck length**

The extension neck is the part between the process connection and the terminal head. As illustrated in the following diagram, the extension neck length influences the temperature in the terminal head. This temperature must remain within the limit values defined in the "Operating conditions" section.

![Diagram showing extension neck length impact on temperature](image)

**Mechanical construction**

**Terminal heads**

All terminal heads have an internal shape and size in accordance with DIN EN 50446, flat face and a thermometer connection of M24x1.5, G1/2" or 1/2" NPT thread. All dimensions in mm (in). The cable glands in the diagrams correspond to M20x1.5 connections. Specifications without head transmitter installed. For ambient temperatures with built-in head transmitter, see the "Operating conditions" section.

1) not for Hastelloy® C276/2.4819 and Inconel 600

Protective sheath

A protective cover made of PTFE (Teflon®), PVDF or tantalum is available for thermowells with straight tips and diameters measuring 11 mm (PTFE/tantalum) and 12 mm (PVDF) (0.43 and 0.47 in). If a protective cover is used, the thermowell outer diameter is 15 mm (PTFE) and 16 mm (PVDF) (0.6 and 0.63 in), 12 mm (0.47 in) for tantalum. The immersion depth L is slightly higher because of the different thermal expansion of the thermowell and protective cover. The upper part of the protective cover is fitted with a disc that is inserted between the flange and counterflange when the thermowell is installed.
Different inserts are available for the thermometer depending on the application:

Weight

From 1.5 to 3.5 kg (3.3 to 7.7 lb) for standard versions.
**Process connection**

The following diagram shows the basic dimensions of the available flanges.

<table>
<thead>
<tr>
<th>Flange</th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image" alt="Diagram of flange dimensions" /></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

For detailed information on the flange connections, refer to the following flange standards:
- ANSI/ASME B16.5
- ISO 7005-1
- EN 1092-1
- JIS B 2220 : 2004

Ideally the flange should be made from the same material as the thermowell. The flanges are therefore available in 316L/1.4404 and in 316Ti/1.4571. Models in Hastelloy® have flanges in basic material 316L/1.4404 and a disc in Hastelloy® on the surface in contact with the process media. An additional protective sheath with a disc at the upper end is used for the PTFE/PVDF/tantalum thermowell version. The surface roughness of the standard flanges ranges from 3.2 to 6.4 µm (Ra). Other types of flanges can be supplied on request.

**Spare parts**

For the spare parts available for the device, refer to the relevant product page at: [www.endress.com](http://www.endress.com) → (search for device name)

**Certificates and approvals**

For the approvals available, see the Configurator on the specific product page: [www.endress.com](http://www.endress.com) → (search for device name)

**Other standards and guidelines**

- IEC 60529: Degree of protection of housing (IP code)
- IEC/EN 61010-1: Safety requirements for electrical equipment for measurement, control and laboratory use
- IEC 60751: Industrial platinum resistance thermometers
- IEC 60584 and ASTM E230/ANSI MC96.1: Thermocouples
- DIN 43772: Thermowells
- DIN EN 50446: Terminal heads

**Material certification**

The material certificate 3.1 (according to standard EN 10204) can be requested separately. The ‘short form’ certificate includes a simplified declaration with no enclosures of documents related to the materials used in the design of the individual sensor but guarantees the traceability of the materials through the identification number of the thermometer. The data related to the origin of the materials can subsequently be requested by the client if necessary.

**Thermowell testing**

Thermowell pressure tests are carried out in accordance with the specifications in DIN 43772. Thermowells with tapered or reduced tips that do not comply with this standard are tested using the pressure of the corresponding straight thermowell. Sensors for use in hazardous areas are also always subjected to a comparative pressure during the tests. Tests according to other specifications can be carried out on request. The liquid penetration test verifies that there are no cracks in the welded seams of the thermowell.
Ordering information

Detailed ordering information is available for your nearest sales organization
www.addresses.endress.com or in the Product Configurator under www.endress.com:

1. Click Corporate
2. Select the country
3. Click Products
4. Select the product using the filters and search field
5. Open the product page

The Configuration button to the right of the product image opens the Product Configurator.

Product Configurator - the tool for individual product configuration

- Up-to-the-minute configuration data
- Depending on the device: Direct input of measuring point-specific information such as measuring range or operating language
- Automatic verification of exclusion criteria
- Automatic creation of the order code and its breakdown in PDF or Excel output format
- Ability to order directly in the Endress+Hauser Online Shop

Accessories

Various accessories, which can be ordered with the device or subsequently from Endress+Hauser, are available for the device. Detailed information on the order code in question is available from your local Endress+Hauser sales center or on the product page of the Endress+Hauser website: www.endress.com.

| DeviceCare SFE100           | DeviceCare          | Configuration tool for devices via fieldbus protocols and Endress+Hauser service protocols.  
DeviceCare is the tool developed by Endress+Hauser for the configuration of Endress+Hauser devices. All smart devices in a plant can be configured via a point-to-point or point-to-bus connection. The user-friendly menus enable transparent and intuitive access to the field devices.  
For details, see Operating Instructions BA00027S |

| FieldCare SFE500            | FieldCare           | FDT-based plant asset management tool from Endress+Hauser. It can configure all smart field units in your system and helps you manage them. By using the status information, it is also a simple but effective way of checking their status and condition.  
For details, see Operating Instructions BA00027S and BA00065S |

W@M | Life cycle management for your plant  
W@M offers assistance with a wide range of software applications over the entire process: from planning and procurement to the installation, commissioning and operation of the measuring devices. All the relevant information is available for every measuring device over the entire life cycle, such as the device status, device-specific documentation, spare parts etc.  
The application already contains the data of your Endress+Hauser device.  
Endress+Hauser also takes care of maintaining and updating the data records.  
W@M is available:  
Via the Internet: [www.endress.com/lifecyclemanagement](http://www.endress.com/lifecyclemanagement)

**Thermowell sizing tool**  
ℹ️ The ‘Thermowell sizing’ tool can be found on the Endress+Hauser website for online calculation and engineering of all Endress+Hauser thermometer thermowells. See [https://wapps.endress.com/applicator](https://wapps.endress.com/applicator)

**Documentation**  
The following document types are available on the product pages and in the download area of the Endress+Hauser website ([www.endress.com/downloads](http://www.endress.com/downloads)):

<table>
<thead>
<tr>
<th>Document</th>
<th>Purpose and content of the document</th>
</tr>
</thead>
</table>
| Technical Information (TI) | **Planning aid for your device**  
The document contains all the technical data on the device and provides an overview of the accessories and other products that can be ordered for the device. |
| Brief Operating Instructions (KA) | **Guide that takes you quickly to the 1st measured value**  
The Brief Operating Instructions contain all the essential information from incoming acceptance to initial commissioning. |
| Operating Instructions (BA) | **Your comprehensive reference**  
The Operating Instructions contain all the information that is required in various phases of the life cycle of the device: from product identification, incoming acceptance and storage, to mounting, connection, operation and commissioning through to troubleshooting, maintenance and disposal. |
| Description of Device Parameters (GP) | **Reference for your parameters**  
The document provides a detailed explanation of each individual parameter. The description is aimed at those who work with the device over the entire life cycle and perform specific configurations. |
| Safety Instructions (XA) | Depending on the approval, the following Safety Instructions (XA) are supplied with the device. They are an integral part of the Operating Instructions.  
ℹ️ The nameplate indicates the Safety Instructions (XA) that are relevant to the device. |
| Supplementary device-dependent documentation | Additional documents are supplied depending on the device version ordered: Always comply strictly with the instructions in the supplementary documentation. The supplementary documentation is an integral part of the device documentation. |
