Stamolys CA71NO

Nitrite analyzer

Compact photometric analysis system for the nitrite measurement in drinking water, wastewater and in mineral waters

Application

- Nitrite monitoring in drinking water
- Nitrite monitoring in sewage treatment plants
- Nitrite monitoring in the mineral water production

Your benefits

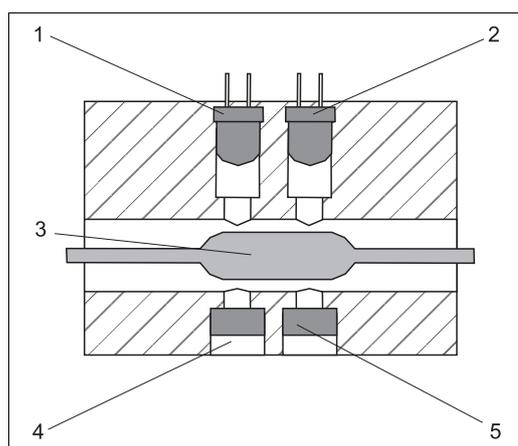

- Stainless steel or glass-fibre reinforced carbon housing available
- Two channel version available
- Measured value storage using integrated data logger
- Automatic calibration and self-cleaning
- Free selectable measuring, cleaning and calibration intervals

Function and system design

Measuring principle CA71NO-A/B/C

After sample conditioning, the analyzer sample pump conveys a part of the filtrate to a mixing vessel. The reagent pump adds reagent at a specific ratio. As a result of the reaction, the sample turns a characteristic colour. The photometer determines the sample's absorption of an emitted light at a specific wavelength (s. Fig., Pos. 2). The wavelength is parameter specific. The absorbance is proportional to the concentration of the specified parameter in the sample (Pos. 3). Additionally, the absorption of a reference light is determined to receive a genuine measuring result. The reference signal is subtracted from the measuring signal to prevent any effects due to turbidity, contamination and ageing of the LEDs.

The temperature in the photometer is controlled thermostatically so that the reaction is reproducible and takes place within a short period of time.

Photometric principle

Measuring principle CA71NO-D

The LED sends light at a defined wavelength through the sample. The intensity of the received light is measured by the detector and converted to an electrical signal. In the analyzer, the respective concentration is calculated from the proportion of light absorbed by the sample.

Photometric measuring principle

Nitrite

Nitrite is a metastable intermediate stage of bacterial oxidation: proteins, urea → ammonium → nitrite → nitrate.

Thus nitrite serves as an indicator in sewage treatment plant processes or in discharge streams of incomplete nitrification.

Nitrite is often added to process and cooling water as a corrosion inhibitor. The Food Industry uses it as a preservative (e.g. pickling salt).

Nitrite occurs very rarely in surface waters since it easily oxidizes to nitrate in the presence of air. High nitrite concentrations in water therefore indicate the presence of partially disintegrated, organic wastes.

There should be no nitrite present in drinking water due to its toxicity (limit value according to the German Trinkwasserverordnung (drinking water ordinance): 0.1 mg/l (ppm)). Nitrite causes haemoglobin to convert to methaemoglobin which suppresses take up of oxygen in the blood ("inner asphyxiation").

Photometric nitrite determination**Naphthylamine method for nitrite determination acc. to DIN 38405-D10**

Under acidic conditions, nitrite ions diazotize sulphonamido, which forms a red dye in conjunction with N-(1-naphthyl)-ethylenediamine.

The absorption is determined at a wavelength of 565 nm. The absorption intensity is proportional to the nitrite concentration in the sample.

The reference wavelength is 880 nm.

Interferences

No interferences up to the given concentration:

Concentration [mg/l (ppm)]	Interference
1,000	Cl ⁻ , SO ₄ ²⁻
700	Cd ²⁺
500	Na ⁺ , K ⁺ , Ca ²⁺
50	Pb ²⁺ , Zn ²⁺ , Ni ²⁺ , Fe ²⁺ , Fe ³⁺ , Co ²⁺ , Hg ²⁺ , Ag ⁺ , NiO ₃ ⁻ , CO ₃ ²⁻
25	Sn ²⁺
10	Cr (VI)

Copper causes decreases in nitrite measured value.

Sample conditioning**Micro/ultrafiltration (Stamoclean CAT430, optional)**

A membrane filter element is suspended directly into the wastewater basin or channel. A hose pump is located in a pump box on the basin rim. The pump creates a vacuum between the membrane and the carrier plate of the filter element. This vacuum makes the filtrate pass through the filter membrane. Suspended materials, particles, algae and bacteria are collected on the surface of the membrane.

Due to alternating pumping and pause, intervals of more than one month are achieved between cleaning cycles. Parallel connection of two or four filter elements increases the sampling quantity up to approx. 1 l/h (0.26 gal/hr).

The hose pump pressure transports the sample to a collecting vessel near the analyzer over a distance of 20 m (66 ft). For distances up to 100 m (330 ft) the sample is transported to the collecting vessel by means of compressed air. The analyzers suck the needed sample volume from the collecting vessel.

Membrane filtration (Stamoclean CAT411, optional)

A sample flow of 0.8 to 1.8 m³/h (3.5 to 7.9 gal/min) is continuously conducted through the micro filter via a pressure pipe. A part of the sample passes the filter membrane and is then conveyed to the measuring device as filtrate.

Sampling is based on the cross flow filtration principle. The PTFE filter membrane separates particles with sizes > 0.45 µm from the filtrate. These particles are collected in front of the membrane and are washed away with the sample flow.

The medium is conducted in a meander-like channel through the filter element. This results in a constantly high flow rate. The high flow rate generates the self cleaning effect. Therefore, mechanical drives for the generation of a flow at the filter surface are not necessary.

Backwash filter (Stamoclean CAT221, optional)

A sample flow of 1 to 2.5 m³/h (4.4 to 11 gal/min) is permanently conveyed through the backwash filter by means of a sampling pump or compressed air or rinse water. The filtrate passes through the wedge wire sieve and is then transported to the measuring device.

Clogging is minimized by the flow at the wedge wire sieve. Automatic backwashing results in a filter operating time of several weeks.

The automatic backwashing and a small compressor or compressed air resp. rinse water supply guarantee low-maintenance and low-energy operation.

Customer specific solution

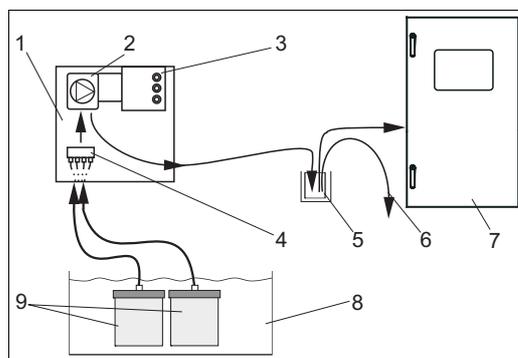

Before analysis, the sample has to be conditioned and to be transported to an external or to the delivered collecting vessel.

Measuring system

A complete measuring system comprises:

- An analyzer
- A sample conditioning system (optionally):
 - Micro filtration / ultra filtration Stamoclean CAT430 or Stamoclean CAT411
 - Backwash filter Stamoclean CAT221
 - Customer specific solution
- Collecting vessel (see product structure)

Note!

With the open version, you need an additional platform for the reagents. Mount this platform max. 35 cm (13.8 inch) below the pumps. The reagent bottles have the following dimensions: 90 x 90 x 215 mm (3.54 x 5.54 x 8.46 inch). The number of bottles varies from 2 to 5 depending on the analyzer version.

For some versions, the outlet pipe must be installed right of the analyzer. See the supplement to the Operating Instructions.

The outlet pipe must be mounted to a wall so that the sample outlet hoses from the photometer have a gradient of 5 to 10 %. If necessary, extend the hoses.

Collecting vessel

Collecting vessel at analyzer (optional)

- 1 Ventilation
- 2 Sample inlet from sampling
- 3 Collecting vessel
- 4 Electrical connections
- 5 Analyzer sample inlet

Certificates and approvals

CE approval

Declaration of conformity

The product meets the legal requirements of the harmonized European standards.
 The manufacturer confirms compliance with the standards by affixing the **CE** symbol.

Test reports

Quality certificate

Depending on the order code, you receive a quality certificate.
 With the certificate the manufacturer confirms compliance with all technical regulations and the successful individual testing of your product.

Scope of delivery

NO-A/B/C

The scope of delivery comprises:

- an analyzer with mains plug
- a cleaning injector
- a tin of silicone spray
- a Norprene hose, length 2.5 m (8.2 ft), ID 1.6 mm (0.06 inch)
- a C-flex hose, length 2.5 m (8.2 ft), ID 6.4 mm (0.25 inch)
- a C-flex hose, length 2.5 m (8.2 ft), ID 3.2 mm (0.13 inch)
- two hose fittings of each size:
 - 1.6 mm x 1.6 mm (0.06 inch x 0.06 inch)
 - 1.6 mm x 3.2 mm (0.06 inch x 0.13 inch)
 - 6.4 mm x 3.2 mm (0.25 inch x 0.13 inch)
- two T-hose fittings of each size:
 - 1.6 mm x 1.6 mm x 1.6 mm (0.06 inch x 0.06 inch x 0.06 inch)
 - 3.2 mm x 3.2 mm x 3.2 mm (0.13 inch x 0.13 inch x 0.13 inch)
- an interference suppressor for the current output
- 4 edge covers
- a quality certificate
- Operating Instructions (English).

NO-D

The scope of delivery comprises:

- an analyzer with mains plug
- a cleaning injector
- a tin of silicone spray
- a Norprene hose, length 2.5 m (8.2 ft), ID 1.6 mm (0.06 inch)
- a Grifflex hose, length 2.0 m (6.6 ft), ID 19 mm (0.75 inch)
- a C-flex hose, length 2.5 m (8.2 ft), ID 3.2 mm (0.13 inch)
- two hose fittings of each size:
 - 1.6 mm x 1.6 mm (0.06 inch x 0.06 inch)
 - 1.6 mm x 3.2 mm (0.06 inch x 0.13 inch)
- two T-hose fittings of each size:
 - 1.6 mm x 1.6 mm x 1.6 mm (0.06 inch x 0.06 inch x 0.06 inch)
 - 3.2 mm x 3.2 mm x 3.2 mm (0.13 inch x 0.13 inch x 0.13 inch)
- an interference suppressor for the current output
- a screwed socket for the outlet pipe
- 4 edge covers
- a quality certificate
- Operating Instructions (English).

Note!

Please, order reagents separately with analyzer version CA71XX-XXXXXX1.

With all other versions, inactive reagents are included in the scope of delivery. You have to mix the reagents before using them. Please, read the instructions attached to the reagents.
